ABSTRACT

A new two Schiff bases derivatives was synthesized and characterized with studying their biological activity and employed Manganese(II), Cobalt(II), Nickel(II), Copper(II) and Mercury(II) complexes: 2-((Z)-4-((Z)-2-hydroxy-1,2-diphenylethylideneamino)-1,5-dimethyl-2-phenyl-1H-pyrazol-3(2H)-ylideneamino) benzoic acid and (E)-4-(2-hydroxy-1,2-diphenylethylideneamino)-1,5-dimethyl-2-phenyl-1H-pyrazol-3(2H)-one. The first ligand were obtained through are action of Benzoin and 4-Aminoantipyrine while the second result from the condensation of the first ligand with 2-aminobenzoic acid. Ten new coordination compounds were synthesized and structurally characterized: [Co(L<sub>1</sub>)(Cl)], [Cu(L<sub>1</sub>)(Cl)] [Ni(L<sub>1</sub>)(Cl)], [Mn(L<sub>1</sub>)(Cl)], [Hg(L<sub>1</sub>)(Cl)], [Co(L<sub>2</sub>)], [Ni(L<sub>2</sub>)], [Cu(L<sub>2</sub>)], [Mn(L<sub>2</sub>)] and [Hg (L<sub>2</sub>)]. All of the suggested chemical structures of the prepared ligands and metal complexes are confirmed by using FT-IR, UV, <sup>1</sup>H & <sup>13</sup>C-NMR spectra. Most of the prepared compounds show antibacterial activity to *Staphylococcus aureus*, *Escherichia coli*, *Bacillus subtilis* and *Pseudomonasaeruginosa*.

**Key words:** Characterization, Schiff bases, 2-Aminobenzoic acid, 4-Aminoantipyrine, Benzoin and biological activity.

INTRODUCTION

Schiff bases or imines are compounds formed by condensation of an active carbonyl group with primary amine<sup>1-5</sup>. These bases containing an amino group (R-C=N) which give the biological importance of these compounds<sup>6</sup>. Schiff's bases have been used extensively as ligands in the field of coordination chemistry. Furthermore the Schiff bases are very important tools for inorganic chemists as these are widely used to design molecular ferromagnetism, in catalysis, in biological modeling applications, as liquid crystals and as heterogeneous catalysts<sup>7-10</sup>. Schiff bases have been widely used as ligands because of high stability in the coordination compounds and their good solubility in common solvents, they are regarded as privileged ligands<sup>11-19</sup>. Tridentate and tetra ligands containing imine groups have also been used as the modulators of structural and electronic properties of transition metal centers<sup>20</sup>. The π-system in a Schiff base often imposes a geometrical constriction and affects the electronic structure as well<sup>21,22</sup>. Thermo chemical properties of Schiff bases have attracted much researcher attention in view of their ability to coordinate metal ions<sup>23-26</sup>,

acting as tri and tetra dentate ligands in metal chelates involving a  $\text{NO}_2$  and  $\text{N}_2\text{O}_2$  Schiff bases donor atom sets. Schiff bases composed of  $\text{NO}_2$  and  $\text{N}_2\text{O}_2$  donor atoms are important chelating ligands for designing supramolecular synthase<sup>27-29</sup>, medicinal and catalytically useful metal complexes<sup>30-32</sup>. Schiff base and their metal complexes are very popular due to their diverse chelating ability. They play an important role in both synthetic and structural research because of their preparation accessibility and structural diversity<sup>33-34</sup>.

Hence, the aim of this work is to describe the preparation, characterization and biological evaluation of sensitive transition metal complexes with new two ligands type of triandtetradentate Schiff bases (Fig. 1 and 2). Metal complexes with two new ligands may be used as precursors for synthesis of new compounds.

## EXPERIMENTAL

### Materials and methods

**Materials:** All chemicals benzoin, 4-aminoantipyrine, 4-aminobenzoic acid, and various metal (II) chlorides used were obtained from Merck products and used as received. The Methanol, Ethanol, DMSO, DMF and another solvents used in this study were of HPLC grade and purchased from Fisher Scientific Pittsburgh, PA Analytical grade chemicals were used throughout the study, unless otherwise stated.

**Methods:** Micro analytical data,  $^1\text{H}$ - &  $^{13}\text{C}$ -NMR spectra of the compounds were recorded at Brukerspecrospin ultra shield magnets 300 MHz instrument using tetramethylsilane (TMS) as an internal standard and  $\text{DMSO-d}_6$  as a solvent in Sharif University of technology in Iran. Products were examined by FT-IR spectra were recorded on SHIMADZU FTIR-8400 Fourier Transform Infrared spectrophotometer as KBr disc. The chloride content for complexes were determined using potentiometric titration method on (686-Titro Processor- 665 Dosim A-Metrohm/Swiss. Magnetic susceptibility measurements were obtained at room temperature on the solid state applying Faraday's Method using Bruker BM6 instrument at 298°K. Micro analysis (C, H, and N%) of the synthesized compounds was carried out in the central service laboratory, College of Education for Pure Science, Ibn Al-Haitham using a CHN Analyzer on Perkin Elmer

2400 series II. Melting points were determined by using (start melting point Apparatus) type Digimelt (MSRS). The proposed molecular structure of the compounds were drawing by using Chem. Office Prog. 3DX (2006).

### Synthesis of Schiff bases ligands ( $L_1$ & $L_2$ )

An ethanolic solution of (40 mL) 4-aminoantipyrine (4.06 g, 0.025 mmole) was added to an ethanolic solution of benzoin (3.14 g, 0.01 mmole) and three drops from glacial acetic acid. The resultant mixture was refluxed for *ca.* 8 hr. The solid product formed was filtered and recrystallized from ethanol<sup>1,2</sup>.

An ethanolic solution of 2-((Z)-4-((Z)-2-hydroxy-1, 2-diphenylethylideneamino)-1, 5-dimethyl-2-phenyl-1H-pyrazol-3(2H)-ylideneamino) benzoic acid (3.51 g, 0.01 mmole) was added to an ethanolic solution of 2-aminobenzoic acid (1.37 g, 0.01 mmole), and the resultant mixture was refluxed for *ca.* 36 hr after the addition of anhydrous potassium carbonate. The potassium carbonate was filtered off from the reaction mixture and the solvent was evaporated<sup>3,4</sup>. The yellow solid separated was filtered and recrystallized from ethanol as follows in (Scheme 1 and 2). The characteristic physical properties of two compounds are shown in Table 1.

(Z)-2-(4-Amino-1,5-dimethyl-2-phenyl-1H-pyrazol-3(2H)-ylidenearnino)benzoix acid

### Synthesis of metal (II) complexes

A solution of metal (II) chlorides in ethanol (2 mmole) was stirred with ethanolic solution of the Schiff base (2 mmole), for ca. 2 h on a magnetic stirrer at 50°C. The solid complex precipitated was filtered off and washed thoroughly with ethanol and dried in vacuum, recrystallized from a hot of (10 mL) ethanol, a coloured precipitate was formed<sup>5,6</sup>. The physical properties of complexes were listed in Table 1.

## RESULTS AND DISCUSSION

The Schiff base ligands (L<sub>1</sub> and L<sub>2</sub>) are yellow and orange crystals, but the prepared complexes of these ligands vary in colour depending of metal ion. All the prepared compounds are stable at room temperature<sup>6</sup>. They are in soluble in water but soluble in MeCN, DMF and DMSO. The ligands are interaction with Cu(II), Co(II), Ni(II), Mn(II) and Hg(II) chlorides, yields of complexes corresponding to the general formulas [M(L<sub>1</sub>)Cl] and [M(L<sub>2</sub>)] where M = Cu(II), Co(II), Ni(II), Mn(II) and Hg(II); L<sub>1</sub> = C<sub>25</sub>H<sub>23</sub>N<sub>3</sub>O<sub>2</sub> & L<sub>2</sub> = C<sub>32</sub>H<sub>28</sub>N<sub>4</sub>O<sub>3</sub>. These stoichiometric assignment were supported by the microanalytical data. The low molar conductance values of the complexes (7-18 ohm cm<sup>2</sup> mol<sup>-1</sup>) support their neutral nature as in Table 3)<sup>7,8</sup>.

## NMR Spectrum

The  $^1\text{H}$  NMR spectrum of the first new Schiff base  $L_1$  in  $\text{DMSO-d}_6$  solution showed the following signals in  $\delta$  ppm at: (2.072, singlet, 1H for -OH Hydroxyl group of benzoin); (2.377, singlet, 3H for = C- $\text{CH}_3$ ); (2.479, singlet, 6H for DMSO protons); (3.385, singlet, 3H for = N- $\text{CH}_3$  group of antipyrine compound); (5.17, singlet, 1H, -CH-OH group of benzoin compound); and the rang at (6.540-8.126) for 3 benzene ring protons<sup>9</sup>.

The  $^1\text{H}$  NMR spectrum of the second new Schiff base  $L_2$  in  $\text{DMSO-d}_6$  solution showed the following signals in  $\delta$  ppm at: (2.072, singlet, 1H for -OH hydroxyl group of benzoin); (2.377, singlet, 3H for =C- $\text{CH}_3$ ); (2.479, singlet, 6H for DMSO protons); (3.385, singlet, 3H for = N- $\text{CH}_3$  group of benzoin compound); (5.17 single, 1H -CH-OH group of benzoin compound); the rang at (6.540-8.126) for 4 benzene ring protons); and (13.36, single, 1H for -OH carboxyl group of 2-aminobenzoic acid)<sup>10</sup>.

The  $^{13}\text{C}$  NMR spectrum of  $L_1$  in  $\text{DMSO-d}_6$  solution showed the signals at: (14.10 for = C- $\text{CH}_3$  group); (35.75 for N- $\text{CH}_3$  group); (40.80 for DMSO); (80.05 attributed to -C-OH moiety); (107.43 for = C-N); (122.70~149.88 to 3 benzene rings. The peak observed at 159.61 for C=O carbonyl group of antipyrine compound; and the signal at 165.19 for the C=N imine group<sup>11</sup>.

The  $^{13}\text{C}$  NMR spectrum of  $L_2$  in  $\text{DMSO-d}_6$  solution shows the signals at: (14.10 for =C- $\text{CH}_3$  group); (35.75 for N- $\text{CH}_3$  group); (40.80 for DMSO); (80.05 attributed to -C-OH moiety); (107.43 for = C-N); (122.70~149.88) to 4 benzene rings. The peak observed at 159.61 for C=O carbonyl group of antipyrine compound; and the signal at 165.19 for the C=N imine group. The peaks observed at 159.19 and 165.19 are attributable to the two C=N imine groups, respectively. The peak observed at 165.19 is due to the acidic CO-OH group present in the 2-aminobenzoic acid<sup>12</sup>.

## Infrared spectral analysis

Infrared spectra of metal complexes of the Schiff base ligand were compared with that of the Schiff base in order to determine the coordination sites that may involve in chelation. These FT-IR data of the compounds were summarized in Table 1. The IR spectra provide valuable information regarding the nature of the functional group attached to the metal atom<sup>13</sup>. The O-H stretching frequency of the ligand ( $L_1$ ) exhibits broad weak intensity band in the 3000-3500  $\text{cm}^{-1}$  range, which is assigned to the intra molecular hydrogen bond O-H...N=C. This band disappeared in the spectra of the complexes. A strong sharp absorption band around 1660  $\text{cm}^{-1}$  in the spectrum of the Schiff base ligand can be assigned to the C=N stretching. In all the complexes, this band is shifted to lower frequencies in the range (1636-1647  $\text{cm}^{-1}$ ) upon complexation with the metal, which can be attributed to the coordination of the imine nitrogen to the metal center<sup>15</sup>.

However, strong band at 1739  $\text{cm}^{-1}$  in the spectrum of the free ligand, which was attributed to the C=O but shifted towards lower frequencies at range (1707-1714  $\text{cm}^{-1}$ ) also indicated the coordination of oxygen atom of these carbonyl group<sup>17</sup>. The frequency of the alcoholic oxygen (C-O) of the free ligand at 1170  $\text{cm}^{-1}$  was shifted to lower frequency ( $\Delta\nu = 15-28 \text{ cm}^{-1}$ ) in the complexes, suggesting the participation of alcoholic group(C-O) inchelation<sup>18</sup>. The new bands between (569-585  $\text{cm}^{-1}$ ) and (420-431  $\text{cm}^{-1}$ ) were assigned to stretching frequencies of  $\nu(\text{M-O})$  and  $\nu(\text{M-N})$ , respectively<sup>19,20</sup>. Therefore, from the IR spectra, it is concluded that ( $L_1$ ) behaves as a tridentate ligand with ONO donor sites coordinating to the metal ions via the azomethine N, carbonyl O atom and deprotonated alcohol O atom.

The FT-IR spectrum of the ligand ( $L_2$ ) showed the peak at ( $3406\text{ cm}^{-1}$ ) attributed to O-H alcoholic group, ( $3388\text{-}2544\text{ cm}^{-1}$ ) due to intramolecular hydrogen bonded -OH alcohol groups of alcohol and carboxylic acid<sup>18</sup>. This bands were absent in the spectra of complexes indicating the dissociation indicating the dissociation of the carboxylic proton on complexation and involvement of alcohol anionic oxygen in coordination<sup>22</sup>. IR spectra of ligand ( $L_2$ ) showed two peaks at ( $1662, 1620\text{ cm}^{-1}$ )  $\nu(\text{C}=\text{N})$  and absence of C=O peak at around ( $1707\text{-}1739\text{ cm}^{-1}$ ) indicates the Schiff base ( $L_2$ ) formation, which were shifted to lower frequencies at ( $1651\text{-}1639$ )  $\text{cm}^{-1}$  and ( $1610\text{-}1636$ )  $\text{cm}^{-1}$  in the spectrum of the complex, showing the participation of C=N nitrogen in the coordination to the metal ion<sup>23</sup>. The ligand acts as a tetra dentate chelating agent, bonded to the metal ion via the two nitrogen atoms of ( $-\text{C}=\text{N}$ ) azomethine group, oxygen atom of (COOH) carboxylate group and oxygen atom of C-OH alcohol for the Schiff base. Moreover, the strong band at  $1176\text{ cm}^{-1}$  due to (C-O) alcohol in the ligand was shifted to the  $1130\text{-}1138\text{ cm}^{-1}$  in the spectra of complexes. Further, the spectrum showed bands at ( $1539\text{-}1568$ )  $\text{cm}^{-1}$  and ( $1408\text{-}1327$ )  $\text{cm}^{-1}$ , which assigned to  $\nu_{\text{asym}}(\text{COO}^-)$  and  $\nu_{\text{sym}}(\text{COO}^-)$ , respectively in the free ligand spectrum, was shifted to lower frequency and appeared at ( $1510$ )  $\text{cm}^{-1}$  and ( $1317$ )  $\text{cm}^{-1}$ .<sup>23</sup> The alcoholic C-O stretching vibration that appeared at ( $1176\text{ cm}^{-1}$ ) in Schiff base shifted towards higher frequencies ( $20\text{-}31$ )  $\text{cm}^{-1}$  in the complexes. This shift confirms the participation of oxygen in the C-O-M bond. Finally, the appearance of two non-ligand bands in the two ranges ( $555\text{-}590$ )  $\text{cm}^{-1}$  and ( $447\text{-}489$ )  $\text{cm}^{-1}$  in all the complexes could be assigned to the stretching frequencies of  $\nu(\text{M-O})$  and  $\nu(\text{M-N})$ , respectively, which further confirm that the ligand is tetra dentate in nature<sup>24</sup>. Therefore, from the IR spectra, it is concluded that H2L behaves as a tetra dentate ligand with ONNO donor sites coordinating to the metal ions via the azomethine N and deprotonated alcoholic O atoms

### Electronic spectra and magnetic moments

Within the UV spectrum of the ligands ( $L_1$  and  $L_2$ ), we observed the existence of 2 absorption bands assigned to the transitions  $n \rightarrow \pi^*$  and  $\pi \rightarrow \pi^*$  at  $343\text{ nm}$  ( $29154\text{ cm}^{-1}$ ) and  $289\text{ nm}$  ( $34602\text{ cm}^{-1}$ ) for  $L_1$  and  $309\text{ nm}$  ( $32362\text{ cm}^{-1}$ ) and  $275\text{ nm}$  ( $36363\text{ cm}^{-1}$ ) for  $L_2$ , respectively. These transitions were also in the spectra of the complexes, but they shifted to lower frequencies<sup>25</sup>.

The electronic spectrum of data of the metal complexes in DMSO solution are given in Table 4. The nature of the ligand field around the metal ion has been deduced from the electronic spectra.

In the electronic spectrum of cobalt(II) complex of  $L_1$  a single broad band at  $617\text{ nm}$  ( $16207\text{ cm}^{-1}$ ) has been observed, which is attributed to  $4A_2 \rightarrow 4T_1(P)$  transition<sup>16</sup>. This confirms the presence of tetrahedral geometry for cobalt complex. While the Electronic spectrum of cobalt (II) complex of  $L_2$  shows two peaks at  $804\text{ nm}$  ( $12437\text{ cm}^{-1}$ ) and  $487\text{ nm}$  ( $20533\text{ cm}^{-1}$ ) are assigned for the  $4A_2 \rightarrow 4T_1(F)$  and  $4A_2 \rightarrow 4T_1(P)$  transitions<sup>26</sup>. This confirms the presence of tetrahedral geometry for cobalt complex.

Nickel (II) complex of  $L_1$  has a (d8) configuration giving peak, found at  $419\text{ nm}$  ( $23866\text{ cm}^{-1}$ ) is assigned  $3T_2 \rightarrow 3T_2$  excitation. The magnetic moment is 3.8 B. M. Thus, the tetrahedral geometry has been suggested for the nickel complex. While the electronic spectrum of Nickel (II) complex of  $L_2$  shows two peaks at  $421\text{ nm}$  ( $23752\text{ cm}^{-1}$ ) and  $806\text{ nm}$  ( $12406\text{ cm}^{-1}$ ) are assigned for the  $1A_1g(F) \rightarrow 2E_g$  and  $1A_1g \rightarrow 1B_2g$  transitions<sup>27</sup>, respectively. It is a diamagnetic complex. Therefore, square planar geometry has been assigned for this complex.

The electronic spectrum of copper(II) complex of  $L_1$  showed one high intense absorption peak at  $411\text{ nm}$  ( $24330\text{ cm}^{-1}$ ), which has been assigned to  $2E \rightarrow 2B_2$  transition. Its magnetic moment is 2.5 B.M. A tetrahedral geometry has been assigned for this Cu(II) complex<sup>28</sup>. Also the electronic spectrum of copper(II) complex of  $L_2$  showed two bands of appreciable intensity at  $643\text{ nm}$  ( $15552\text{ cm}^{-1}$ ) and  $522\text{ nm}$  ( $19157\text{ cm}^{-1}$ ),

which have tentatively been assigned to  ${}^2B_{1g} \rightarrow {}^1B_{1g}$  and  ${}^1A_{1g}(F) \rightarrow {}^2E_g$  transitions, respectively. The magnetic moment is 1.90 B.M. Thus the square planar geometry has been assigned for this complex.

The absorption spectrum of manganese(II) complex of  $L_1$  exhibited two bands at 423 nm ( $23640\text{ cm}^{-1}$ ) and 562 nm ( $17793\text{ cm}^{-1}$ ), which are assignable to  $6A_1 \rightarrow 4A_1(G)$  and  $6A_1 \rightarrow 4E(G)$  transitions respectively<sup>29</sup>. Its magnetic moment is 5.57 B.M. Therefore, tetrahedral geometry has been assigned for this complex. While the absorption spectrum of manganese (II) complex of  $L_2$  showed two bands at 407 nm ( $24570\text{ cm}^{-1}$ ) and 546 nm ( $18315\text{ cm}^{-1}$ ), which have been assigned to  $6A_1 \rightarrow 4A_1(G)$  and  $6A_1 \rightarrow 4E(G)$  transitions, respectively. The magnetic moment is 5.72 B.M. Thus the tetrahedral geometry has been assigned for this complex<sup>30</sup>.

The complex mercury (II) of  $L_1$  and  $L_2$  is diamagnetic giving peaks, found in  $L_1$  at 367 nm ( $27247\text{ cm}^{-1}$ ) and found at 330 nm ( $30303\text{ cm}^{-1}$ ) in  $L_2$  were assigned to charge transfer transitions. The absence of absorption peaks in the visible region indicated no (d-d) electronic transition happened; this a good result for square planar<sup>31</sup>.

### Biological activity

The antibacterial activity of the synthesized ligands ( $L_1$ ), ( $L_2$ ) and their complexes, were tested utilizing the agar diffusion technique<sup>32</sup>. The organism tested was *Staphylococcus aureus*, *Escherichia coli*, *Bacillus* and *Pseudomonas*. The agar media were inoculated with test organisms and a solution of the tested compound 100  $\mu\text{g/mL}$  was placed separately in cups (6 mm diameter) in the agar medium. The inhibition zones were measured after 24 hrs incubation. Separate studies were carried out with the solution alone of DMSO and the showed no activity against any bacterial strains<sup>33-35</sup>. The results of these studies revealed that the ligands and metals complexes showed an effective in the inhibition of all type bacterial. Biological activity of the previous compounds in inhibition of bacterial growth could be attributed to one of the following mechanisms, the first mechanism is by the inhibition of the bacterial cell wall synthesis by bounding to the precursor of the cell wall, and second mechanism revealed that some antibodies have similar stereo structure to substrate. All standards also screened under the similar condition for comparison. Results of all given activities of above compounds were given in (Tables 4 (a, b)).

**Table 4(a): Diameter of zone of inhibition (mm) of  $L_1$**

Comp.	$L_1$	[Co( $L_1$ )Cl]	[Ni( $L_1$ )Cl]	[Cu( $L_1$ )Cl]	[Mn( $L_1$ )Cl]	[Hg( $L_1$ )Cl]

## CONCLUSION

From the elemental analysis, molar conductivity, UV-Vis magnetic, IR, <sup>1</sup>H- & <sup>13</sup>C-NMR spectral data, it is possible to determine the type of coordination of the ligand in their metal complexes. Based on these data, Tetrahedral and Square planar geometries are assigned to these complexes. The new Schiff ligands (L<sub>1</sub>), (L<sub>2</sub>) and metal complexes were prepared Co (II), Cu (II), Ni (II), Mn(II) and Hg(II) complexes. The metal (II) ions were coordinated with O atom for hydroxyl group (O-H), O atom for carbonyl group (C=O) and N atom for imine group (H-C=N) of ligand (L<sub>1</sub>), while the complexes for ligand (L<sub>2</sub>) b were coordinated with O atom for hydroxyl group (O-H), O atom for carboxyl group (C=O) and two N atoms for imine groups (H-C=N). Spectroscopic, structural and magnetic data show that all complexes are four-coordinate metal complexes owing to the ligation of the Schiff bases.

## ACKNOWLEDGMENT
