## ABSTRACT

Ferrocene on reaction with $\mathrm{HgXCN}[\mathrm{X}=\mathrm{S}, \mathrm{Se}]$ forms 1, $1^{\prime}$ bis (thiocyanato/ selenocyanato) ferrocene. This compound acts as bidendate ligand and forms an adduct with $\mathrm{M}(\mathrm{NCS})_{2}[\mathrm{M}=\mathrm{Fe}(\mathrm{II}), \mathrm{Co}(\mathrm{II}), \mathrm{Ni}(\mathrm{II}), \mathrm{Cu}(\mathrm{II}), \mathrm{Zn}(\mathrm{II})]$. The bond length, bond order and bond angle of the ligands and the adducts have been evaluated with the help of Cache software. The bond length and bond angle indicate that basic structure of ferrocene is not altered after the formation of ligand or the adducts. The bidentate nature of $1,1^{\prime}$ bis(thiocyanato/selenocyanato) ferrocene is supported by the bond angles. The bond angles around M in various compounds is either 113 degree or 180 degree, which shows that M is well exposed for further reaction. The length of M-NCS bond changes on change of M which is the following order $\mathrm{Zn}>\mathrm{Cu}>\mathrm{Ni}>\mathrm{Fe}>\mathrm{Co}$. This change has been attributed to the difference in the nature of sd hybridization.

## INTRODUCTION

In our recent communication we have made new study on molecular structure of ferrocene ${ }^{[1]}$ with the help of computational chemistry, using molecular mechanics method with EHT option. Ferrocene is well known compound and its crystographic structore was established in $1956^{[2]}$. About a decade ago
we synthesized a large number of complexes of ferrocene derivatives and established their structures with the help of infrared, and electronic spectral studies, besides other physico-chemical techniques ${ }^{[3-1]}$. Crystographic structure of these complexes could not be performed for want of necessary requirements. The computational chemistry ${ }^{[12]}$ and availability of software have made it possible to obtain such infor-
mations about a molecule which were earlier possible only by crystographic study. The importance of bond length and bond angle in describing the nature of bonding in a compound has recently been emphasized ${ }^{[13]}$. We in this paper present a study on bond length and bond angles of a series of compounds of ferrocene.

## MATERIAL AND METHOD

The compounds, which are study material of this paper, are listed in TABLE 1. These compounds have been prepared and studied by us in our earlier work ${ }^{[3-}$ ${ }^{11]}$. For present study the 3D modeling and geometry optimization of all the compounds have been done with the help of PCMODEL software using the semiempirical PM3 Hamiltonian. The MOPAC calculation of bond length, bond order and bond angle were performed with Cache software. The optimized structure of compounds (2) and (3) is shown in figure 1 and of (4-13) is shown in figure-2.

## RESULT AND DISCUSSION

The first stage of the study is confined to the measurements of various bond length, bond order and bond angles of ferrocene followed by the same measurements of the $1,1^{\prime}$-bis(thiocyanato/selenocyanato mercurio) ferrocene (Figure-1) and of the

Figure $1: 1,1^{\prime}$-bis(thiocyanato/selenocyanato mercuris) ferrocene (Compounds-2,3)

| $\mathrm{N}_{24}-\mathrm{Fe}_{20}$ | 1.920 | 1.910 | 1.920 | 1.950 | 2.000 | 1.920 | 1.910 | 1.950 | 1.950 | 2.000 |
| $\mathrm{S}_{23}-\mathrm{N}_{21}$ | 2.743 | 2.443 | 2.743 | 2.743 | 2.743 | 2.743 | 2.743 | 2.743 | 2.743 | 2.743 |

in six cases and $1.352 \AA$ in four cases. Fe-C bonds have length in the range $2.2 \AA$ in eight bonds and 2.1 $\AA$ in two cases. However, there is little difference in length in all the cases. The bond angles in ferrocene between C-C-C are very close to 109 degree C-Fe-C arte in the range of $35-40$ degree.

On reaction with HgSCN and HgSeCN , the ferrocene is converted into $1,1^{\prime}$-bis(thiocyanato mercurio) ferrocene and $1,1^{\prime}$-bis(selenocyanato) ferrocene that is compound (2) and (3). The bond length, bond order and bond angles are presented in the TABLE 4. The bond length, bond order and bond angles of various bonds of ferrocene remain intact and there is no change in them hence the bonds of ferrocene are not included in the TABLE. This observation supports the stability of the ferrocene.

The new bonds, which are created after the formation of compound of (2) and (3), are the following:

| $\mathrm{C}_{5}-\mathrm{Hg}_{12}$, | $\mathrm{C}_{6}-\mathrm{Hg}_{13}$, | $\mathrm{Hg}_{12}-\mathrm{X}_{14}$, |
| :--- | :--- | :--- |
| $\mathrm{Hg}_{13}-\mathrm{X}_{15}$, | $\mathrm{X}_{14}-\mathrm{C}_{16}$, | $\mathrm{X}_{15}-\mathrm{C}_{17}$, |
| $\mathrm{C}_{16}-\mathrm{N}_{18}$, | $\mathrm{C}_{17}-\mathrm{N}_{19}$, | $\mathbf{X}=\mathrm{S}^{2}$ and Se |

The bond lengths of the above bonds in thio and seleno derivatives have same length, but they differ in $\mathrm{Hg}-\mathrm{S}, \mathrm{Hg}-\mathrm{Se}, \mathrm{C}-\mathrm{S}, \mathrm{C}-\mathrm{Se}$ bond lengths. The bond length between mercury and sulphur bond is 2.510 $\AA$, between mercury and selenium bond is $2.650 \AA$, between sulphur and carbon is $1.790 \AA$ and between selenium and carbon is $1.930 \AA$. The bond angles between Hg -S-C and Hg -Se-C are 120 degree; and between S-C-N, and Se-C-N are 180 degree.

On reaction with $\mathrm{M}(\mathrm{NCS})_{2},[\mathrm{M}=\mathrm{Fe}(\mathrm{II}), \mathrm{Co}(\mathrm{II})$, $\mathrm{Ni}(\mathrm{II}), \mathrm{Cu}(\mathrm{II}), \mathrm{Zn}(\mathrm{II})]$ the $1,1^{\prime}$-bis(mercurio thiocyanato) ferrocene forms compounds no (4-8) and on reaction with its selenocyanate counterpart compound no. (5-13). The bond length and bond order are included in TABLE 4 and 5 respectively. A compara-

tive display of bond length is given in TABLE 2. The smallest bond is of Co-N, followed by $\mathrm{Fe}-\mathrm{N}$ and

The length of metal nitrogen bonds, $\mathrm{N}_{18}-\mathrm{M}_{20}$ and $\mathrm{N}_{19}-\mathrm{M}_{20}[$ Metal $=\mathrm{Fe}(\mathrm{II}), \mathrm{Co}(\mathrm{II}), \mathrm{Ni}(\mathrm{II}), \mathrm{Cu}(\mathrm{II}), \mathrm{Zn}$ (II)] in all the cases are 2.012 and $2.211 \AA$ indicating very clearly that there is no change in length on change of the metal ions. Similarly there are no changes in the length in other bond shown in the TABLE 2. A notable change in the length of metal bonds $\mathrm{N}_{21}-\mathrm{M}_{20}$, and $\mathrm{N}_{24}-\mathrm{M}_{20}$ is however, observed.
$\mathrm{Ni}-\mathrm{N}$; the longest bond is of $\mathrm{Zn}-\mathrm{N}$. The sequence is as below:

```
Zn-N}>\textrm{Cu}>\textrm{N}>\textrm{Ni}-\textrm{N}~\textrm{Co}-\textrm{N}>\textrm{Fe}-\textrm{N
```

The bond angles involving the metal ions are the following and are presented in TABLE 7 for compounds no. (4-13).

The angles cited above are the same in all the cases, irrespective of the metal ions. The angles between $\mathrm{N}_{19}-\mathrm{M}_{20}-\mathrm{N}_{21}, \mathrm{~N}_{19}-\mathrm{M}_{20}-\mathrm{N}_{24}$ and $\mathrm{N}_{18}-\mathrm{M}_{20}-\mathrm{N}_{24}$ are 113.449 degree. This angle is close to angle prescribed for tetrahedron, which is 109.5 degree. The metal ions are supposed to be linked to thiocyanate ions in geometry close to tetrahedron.

The compounds (9-13) are formed when $1,1^{\prime}$ bis (seleno cyanato mercurio) ferrocene is reacted with $\mathrm{M}(\mathrm{NCS})_{2}$. The bond length of $\mathrm{C}_{25}-\mathrm{Se}_{26}$ becomes 1.932 $\AA$ against $1.790 \AA$ in the corresponding sulphur derivative. In other bonds there is no noticeable change. The relevant bond angles as presented above for thiocyanato analogues exhibit no change on change of metal ion $[\mathrm{M}=\mathrm{Fe}(\mathrm{II}), \mathrm{Co}(\mathrm{II}), \mathrm{Ni}(\mathrm{II}), \mathrm{Cu}(\mathrm{II}), \mathrm{Zn}$ (II)] or on change of sulphur to selenium.

The metal ligand bond length and its relation with hybridization has been discussed by Hehre ${ }^{[14]}$ and other ${ }^{[15,16]}$. He has ignored the contribution of p orbitals in hybridization, which is in consonance with the work of the Landis ${ }^{[17]}$ and Kaup ${ }^{[18]}$ and others ${ }^{[19-}$ ${ }^{22}$. Our observation clearly shows that on change of M, the length of both M-NCS bonds changes, the longest being $\mathrm{Zn}-\mathrm{NCS}$ bond and smallest being CoNCS bond. This change is on account of difference in the nature of sd-hybridization.

## CONCLUSION

1. The bond order of carbon-iron bond in ferrocene is 0.314 , whereas the bond order of carbon-carbon bond is 1.25 or more. The difference in bond order indicates that former has sigma bonding and the latter pi boding.
2. The carbon in cyclopentadienyl radical has $\mathrm{sp}^{3}$ hybridization as is indicated by C-C-C, angle which is 109 degree.
3. On change of $M$ the length of both $\mathrm{M}-\mathrm{NCS}$ bonds changes, the longest is when M is Zn , and the sequence is $\mathrm{Zn}>\mathrm{Cu}>\mathrm{Ni} \sim \mathrm{Fe}>\mathrm{Co}$.
4. In compound no. (2), the angle between both the $\mathrm{Hg}-\mathrm{S}-\mathrm{C}$ is 120 degree, which provides a comfortable orientation for acting as bidentate ligand.
5. The bond angles around $M$ in compound (4-13),
are above 113 degree, and some are close to 180 degree, which shows that M is well exposed for further reaction.

## ACKNOWLEDGEMENT

Deepa is grateful to U.G.C., New Delhi for award of Part Time Women Research Associateship.
