#### Abstract

Cyclocandensation of 2-[(substitutedbenzylidene)amino]-4-(3acetanilido)oxazoles (3a-3j) and 2-[(substitutedbenzylidene)amino]-4-(3acetanilido)thiazoles (7a-7j) with chloroacetyl chloride give and N -2-[3-chloro-4-(substitutedphenyl)-2-oxoazetidin-1-yl]-4-(3-acetanilido)oxazoles ( $4 \mathrm{a}-4 \mathrm{j}$ ) and N -2-[3-chloro-4-(substitutedphenyl)-2-oxoazetidin-1-yl]-4-(3acetanilido)thiazoles ( $\mathbf{8 a - 8 j}$ ) respectively. N-2-[2-(substitutedphenyl)-4-oxo1 -thiazolidinyl]-4-(3-acetanilido)oxazoles ( $\mathbf{5 a - 5 j}$ ) and $\mathrm{N}-2-[2-$ (substitutedphenyl)-4-oxo-1-thiazolidinyl]-4-(3-acetanilido) oxazoles ( $\mathbf{5 a} \mathbf{- 5 j}$ ) have been synthesized by reaction of compounds ( $\mathbf{3 a - 3} \mathbf{j}$ ) and ( $\mathbf{7 a - 7} \mathbf{j}$ ) with thioglycolic acid in presence of anhydrous zinc chloride. All the synthesized compounds were screened for their antibacterial activity and compared with reference drugs ampicillin and ciprofloxacin. The compound was the most potent compound of this series. Structure of all the synthesized compounds have been characterized by elemental ( $\mathrm{C}, \mathrm{H}, \mathrm{N}$ ) and spectral (IR and ${ }^{1} \mathrm{H}$ NMR) analysis. © 2010 Trade Science Inc.- INDIA

## INTRODUCTION

The chemistry of heterocyclic compounds has attracted attention in recent time due to its increasing importance in the field of pharmaceuticals and industries. Substitution pattern in oxazole and thiazole derivatives play a pivotal role in delineating the biological activities like antibacterial ${ }^{[1,2]}$, antifungal ${ }^{[3,4]}$, anti-inflammatory ${ }^{[5,6]}$. Several scientistes have synthesized several oxazole and thiazole derivatives which posses potent antibacterial activity. Further various derivatives of azetidinone ${ }^{[7]}$ and thiazolidinone ${ }^{[8]}$ have also been reported to possess antibacterial activity. In light of above observations it
was thought worthwhile to synthesized some new substituted oxa/thiazole derivatives by incorporation of azetidinone and thiazolidinone moieties with the hope to get better antibacterial agents.

## 2-Amino-4-(3-acetanilido)oxazole (2a)

A mixture of iodine ( 0.3 mole) and urea ( 0.6 mole) was triturated and the reaction mixture transfered into a conical flask containing m-acetamidoacetophenone (1) ( 0.3 mole), and heated for 8 h . The solid obtained was washed with diethyl ether, after and then it was washed with sodium thiosulphate. Finally, the reaction mixture was poured in ice water. The solid thus obtained was filtered, washed with water, dried and recrytallized from acetone/hexane to yield compound (2a) (94\%) m.p.: $190^{\circ} \mathrm{C}$; IR (KBr) vcm ${ }^{-1}: 3340\left(\mathrm{NH}_{2}\right), 3291(\mathrm{NH})$, 1671 ( $\mathrm{C}=\mathrm{O}$, amide), 1620 ( $\mathrm{C}=\mathrm{C}$ of aromatic ring), 1070 (C-O-C of oxazole). ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}+\right.$ DMSO-d $)_{6}$ ) in ppm: $9.00\left(\mathrm{~s}, 2 \mathrm{H}, \mathrm{NH}_{2}\right.$ exchangeable with $\mathrm{D}_{2} \mathrm{O}$ ), $7.40-8.24(\mathrm{~m}, 4 \mathrm{H}, \mathrm{Ar}-\mathrm{H}), 7.27(\mathrm{~s}, 1 \mathrm{H}, \mathrm{NH}$ exchangeable with $\left.\mathrm{D}_{2} \mathrm{O}\right), 6.95\left(\mathrm{~s}, 1 \mathrm{H}, \mathrm{CH}\right.$ at $\mathrm{C}_{5}$ of oxazole), $2.34\left(\mathrm{~s}, 3 \mathrm{H}, \mathrm{NHCOCH}_{3}\right)$. (3-acetanilido)oxazoles (3a-3j) ( 0.3 mole), dry dioxane ( 5 ml ) and triethylamine ( 0.6 mole) were taking in a conical flask. The reactions were stirred on an ice bath and when the temperature dropped below $5^{\circ} \mathrm{C}$, then choroacetylchloride ( 0.015 mole) was added drop wise with stirring. After completion of addition the stirring was continued for 10 h at room temperature. The reaction mixtures were then kept a side for 52 h . To ethanolic solution ( 60 mL ) of compounds ( $\mathbf{4 a} \mathbf{-}$ 4j) ( 0.02 mole) thioglycolic acid ( 0.04 mole) was added in the presence of anhydrous zinc chloride. The reaction mixtures were refluxed for 10 h . The excess of solvent was distilled off and separated masses were poured in to ice water, filtered and washed with water and recrystallized from appropriate solvents to give compounds (5a-5j).

N -2-[3-chloro-4-(substitutedphenyl)-2-oxoazetidin-1-yl]-4-(3-acetanilido)thiazoles (8a-8j)

A mixture of 2-[(substitutedbenzylidene)amino]-4-(3-acetanilido)thiazoles ( $\mathbf{7 a - 7 j}$ ) ( 0.01 mole), dry dioxane ( 10 mL ) and triethylamine ( 0.03 mole) were taking in a conical flask. The reactions were stirred on an ice bath and when the temperature dropped bellow $5^{\circ} \mathrm{C}$, then choroacetylchloride ( 0.015 mole) was added drop wise with stirring. After completion of addition the stirring was continued for 10 h at room temperature. The reaction mixtures were then kept a side for 52 h . Finally, the reaction masses were added to ice cold water to obtain the final product. It was filtered, washed with water, dried and recrystallized from ethanol to yield compounds ( $\mathbf{8 a - 8 j}$ ).

## RESULTS AND DISCUSSION

Various substituted derivatives of oxazole and thiazole were synthesized and screened for their anti bacterial activity. The pharmacological results of the compounds have been reported in TABLE 1(a-f).

Coumpound (2a) has shown mild antibacterial activity against S.aureus and E.coli. In corporation of different aromatic aldehydes via $\mathrm{NH}_{2}$ linkage of substituted oxazoles yielded compounds ( $\mathbf{3 a} \mathbf{- 3 j}$ ). Among the compounds ( $\mathbf{3 a} \mathbf{- 3 j}$ ), compound ( $\mathbf{3 a}$ ) was devoid of antibacterial activity. Compounds (3b), (3c), (3d), (3e), (3f), (3g) and (3j) had shown mild antibacterial activity and compounds ( $\mathbf{3 h}$ ) and ( $\mathbf{3 i}$ ) exhibited moderate zone of inhibition against various used pathogens.

Cyclization of compounds ( $\mathbf{3 a}-\mathbf{3 j}$ ) with chloroacetyl chloride in presence of triethylamine yielded corresponding azetidinones ( $\mathbf{4 a}-\mathbf{4 j}$ ). Among the compounds ( $\mathbf{4 a -}$ $\mathbf{4 j}$ ), compounds (4a), (4b), (4e), (4f) and (4g) exhibited moderate antibacterial activity. These compounds exhibited $15-19 \mathrm{~mm}$ antibacterial activity against S.aureus, E.coli, P.vulgaris and K.pneumoniae. Compound (4c) have shown good antibacterial activity (i.e. zone of inhibition 20mm) against E.coli. Compounds $\mathbf{( 4 d ) , ( 4 i )}$ and $(\mathbf{4 j})$ were found to exhibited equipotent antibacterial activity than reference drug. Compound (4h) exhibited good antibacterial activity. This compound showed zone of inhibition 23 mm against S.aureus, 22 mm against P.vulgaris.

Cyclocandensation of compounds ( $\mathbf{3 a} \mathbf{- 3 j}$ ) with thioglycolic acid to give compounds (5a-5j). Among the compounds (5a-5j), compounds (5a), (5e), (5f) and $(\mathbf{5 g})$ exhibited moderate antibacterial activity. On the other hand compounds (5b), (5c), (5d), (5i) and (5j) had shown better antibacterial activity. These compounds exhibited $19 \mathrm{~mm}-23 \mathrm{~mm}$ zone of inhibition against S.aureus, E.coli, P.vulgaris and K.pneumoniae. Compound ( $\mathbf{5 h}$ ) showed antibacterial activity better than standard drug.

Compound (6a) exhibited zone of inhibition 5mm against S.aureus. The addition of different aromatic aldehydes on amino group of thiazole nucleus to give compounds ( $\mathbf{7 a} \mathbf{- 7 j}$ ). Compounds (7a-7j) have shown

proximate lethal dose $\mathrm{ALD}_{50}$ and were found to exhibit a higher value of $\mathrm{ALD}_{50}$ i.e. more than $1000 \mathrm{mg} / \mathrm{kg}$ i.p. except compound 9 h which exhibited $\mathrm{ALD}_{50}$ of more than $2000 \mathrm{mg} / \mathrm{kg}$ i.p. (maximum dose tested). As these compounds have shown high value of $\mathrm{ALD}_{50}$ thus indicating good safety margin.

While considering all the newly synthesized compounds of this series we may concluded that:

1. Presence of thiazoles moiety has shown better antibacterial and antifungal activities than the compounds having oxazoles moiety.
2. 2,6-dichlorophenyl substitution in thiazoles ring showed more potent activity than oxazoles ring.
3. Presence of electronegative atoms at 2 and 6 position in general beneficial for antibacterial and antifungal activities.

## Pharmacological evaluation (Antibacterial activity)

All the synthesized compounds were tested for their antibacterial activity. The effect of unknown compounds were compared with the standard drug Ciprofloxacin and Gattifloxacin and propylene glycol treated group served as control. All the newly synthesized compounds were also screened for their approximate lethal dose $\left(\mathrm{ALD}_{50}\right)$.

Cup-Plate Method (CUPS): This activity was performed by following the method of Chuinckshank et. $\mathrm{al}^{[9]}$. in albino rats. Nutrient agar was poured onto the sterilized petri dishes ( $20-25 \mathrm{~mL}$ each pertri dish). The poured material was allowed to set $(1-1.5 \mathrm{~h})$ and thereafter the "CUPS" ( 10 mm diameter) were made by punching into the agar surface with a sterile cork borer and scooping out the punched part of the agar. Into these cups the test compound solution was added with the help of sterile syringe. The plates were incubated at $37^{\circ} \mathrm{C}$ for 48 hr and the results were noted. A solvent control ( $10 \%$ DMSO in methanol) was also run to not the activity of the blank (solvent). The above said standard drugs were also screened under similar conditions for comparison.

Approximate lethal dose $\left(\mathrm{ALD}_{50}\right)$ : The $\mathrm{LD}_{50}$ was determined in albino rats weighing $100-120 \mathrm{gm}$ of either sex by the method of Smith ${ }^{[10]}$. The test compounds were administered by i.p. route in one group and the same volume of propylene glycol in another group of animals consisting six rats in graded doses. The animals were allowed to take food and water adlibidum. After 24 h of drug administration percent mortality in each group was observed. From the data obtained ALD $_{50}$ was calculated.

## ACKNOWLEDGEMENTS

Authors are thankful to Head, CDRI, Lucknow for providing analytical and spectral data for the compounds.
