#### Abstract

A combinatorial enumeration under the obligatory minimum valency (OMV) restriction is carried out for the series of diamanane analogs where hetero atoms replacing carbon atoms in the parent diamantane are N or O . The pattern inventory includes an indirect subduction of the Coset Representations (CRs) $D_{3 d}\left(/ \mathrm{C}_{3 \mathrm{v}}\right)$ and $\mathrm{D}_{3 \mathrm{~d}}\left(/ \mathrm{C}_{\mathrm{s}}\right)$ assigned, respectively to bridgehead and bridge carbon atoms followed by symmetry adapted calculations using the unit subduced cycle index approach.

Key words: Obligatory minimum valency, Diamantane, Orbits, Coset representation, Unit-subduced-cycle index, Generating function.

## INTRODUCTION

Diamantane or Congressane ${ }^{1-2}$ also known as pentacyclo $\left[7.3 .1 .1^{4,12} .0^{2,7} .0^{6,7}\right]$ tetradecane according to the Von Baeyer systemic nomenclature is a cage shaped hydrocarbon which consists of 2 adamantane units fused together at inverse position along 2 hexagonal faces in chair conformation. It belongs to the family of diamondoïds whose syntheses and numerous applications in nanotechnology, drug delivery and medicine are largely presented in the literature ${ }^{3-8}$.

In a recent study, Nemba et al. ${ }^{9}$ have developed an algorithm for direct combinatorial enumeration of chiral and achiral homopolysubstituted diamantane derivatives. The present work is focused on combinatorial enumeration of the first members of the series of oxo, aza-or oxoaza-diamantane analogs taking account of the obligatory minimum valencies (OMVs) of atoms and the Fujita's scheme of unit subduced cycle indices ${ }^{10-15}$.

The hydrogen depleted diamantane skeleton (Fig. 1) has 8 bridgehead and 6 bridge carbon atoms. Each bridgehead position can take as substituent an atom having three or more valency (for instance C and N ) and cannot accept a monovalent or a divalent atom. On the other hand, a bridge position can take an atom possessing a valency equal to 2 (like O ) or more but cannot accept a monovalent atom. Throughout this study, we assume the OMV $=3$ for bridgehead and OMV $=2$ for bridge positions, respectively.

[^0]
## Mathematical formulation and computational method

Let us consider the hydrogen depleted stereograph of Diamantane $\left(\mathrm{C}_{14} \mathrm{H}_{20}\right)$ in $\mathrm{D}_{3 \mathrm{~d}}$ symmetry shown in Fig. 1 where C atoms are indicated by numerical labels. The 8 bridgehead carbon atoms are partitioned into two orbits
$\Delta_{1}=\{4,9\}$ and
$\Delta_{3}=\{1,2,6,7,11,12\}$
while the bridge carbons form a single orbit

$$
\Delta_{2}=\{3,5,8,10,13,14\}
$$

Fig. 1: Hydrogen depleted stereograph of diamantane with arrows reporting the OMV restriction
The $\mathrm{D}_{3 \mathrm{~d}}$ symmetry point group of diamantane includes 12 symmetry operations detailed in Eq. 1:

$$
\begin{equation*}
D_{3 d}=\left\{E, C_{3}, C_{3}^{2}, C_{2(1)}, C_{2(2)}, C_{2(3)}, i, S_{6}, S_{6}^{5}, \sigma_{d(1)}, \sigma_{\mathrm{d}(2)}, \sigma_{\mathrm{d}(3)}\right\} \tag{1}
\end{equation*}
$$

The right hand side elements of Eq. 1 form six equivalence classes given in Eq. 2:

$$
\begin{equation*}
\{E\},\left\{C_{3}, C_{3}^{2}\right\},\left\{C_{2(1)}, C_{2(2)}, C_{2(3)}\right\},\{i\},\left\{S_{6}, S_{6}^{5}\right\},\left\{\sigma_{d(1)}, \sigma_{d(2)}, \sigma_{d(3)}\right\} \tag{2}
\end{equation*}
$$

whose elements combine and generate a non redundant set of subgroups ${ }^{15-16}$ for $D_{3 d}$ denoted $\operatorname{SSG}_{D_{3 d}}$ given in Eq. 3:

$$
\begin{equation*}
\operatorname{SSG}_{\mathrm{D}_{3 \mathrm{~d}}}=\left\{\mathrm{C}_{1}, \mathrm{C}_{2}, \mathrm{C}_{\mathrm{i}}, \mathrm{C}_{\mathrm{s}}, \mathrm{C}_{3}, \mathrm{C}_{2 \mathrm{~h}}, \mathrm{D}_{3}, \mathrm{C}_{3 \mathrm{v}}, \mathrm{~S}_{6}, \mathrm{D}_{3 \mathrm{~d}}\right\} \tag{3}
\end{equation*}
$$

The $\mathrm{SSG}_{\mathrm{D}_{3 \mathrm{~d}}}$ is used to construct the sequence of coset representations for $\mathrm{D}_{3 \mathrm{~d}}$ denoted $\mathrm{SCR}_{\mathrm{D}_{3 \mathrm{~d}}}$ listed in Eq. 4:

$$
\operatorname{SCR}_{\mathrm{D}_{3 \mathrm{~d}}}=\left\{\begin{array}{l}
\mathrm{D}_{3 \mathrm{~d}}\left(/ \mathrm{C}_{1}\right), \mathrm{D}_{3 \mathrm{~d}}\left(/ \mathrm{C}_{2}\right), \mathrm{D}_{3 \mathrm{~d}}(/ \mathrm{Ci}), \mathrm{D}_{3 \mathrm{~d}}\left(/ \mathrm{C}_{\mathrm{s}}\right), \mathrm{D}_{3 \mathrm{~d}}\left(/ \mathrm{C}_{3}\right), \mathrm{D}_{3 \mathrm{~d}}\left(/ \mathrm{C}_{2 \mathrm{~h}}\right),  \tag{4}\\
\left.\left.\mathrm{D}_{3 \mathrm{~d}}\left(/ \mathrm{D}_{3}\right), \mathrm{D}_{3 \mathrm{~d}} / / \mathrm{C}_{3 \mathrm{v}}\right), \mathrm{D}_{3 \mathrm{~d}}\left(/ \mathrm{S}_{6}\right), \mathrm{D}_{3 \mathrm{~d}} / / \mathrm{D}_{3 \mathrm{~d}}\right)
\end{array}\right\}
$$

The explicit forms of these different coset representations (CRs) are given as follows:

$$
\begin{gather*}
\mathrm{D}_{3 \mathrm{~d}}\left(/ \mathrm{C}_{1}\right)=\mathrm{C}_{1} \mathrm{E}+\mathrm{C}_{1} \mathrm{C}_{3}+\mathrm{C}_{1} \mathrm{C}_{3}{ }^{2}+\mathrm{C}_{1} \mathrm{C}_{2(1)}+\mathrm{C}_{1} \mathrm{C}_{2(2)}+\mathrm{C}_{1} \mathrm{C}_{2(3)}+\mathrm{C}_{1} \mathrm{i}+\mathrm{C}_{1} \mathrm{~S}_{6}+\mathrm{C}_{1} \mathrm{~S}_{6}{ }^{5} \\
+\mathrm{C}_{1} \sigma_{\mathrm{d}(1)}+\mathrm{C}_{1} \sigma_{\mathrm{d}(2)}+\mathrm{C}_{1} \sigma_{\mathrm{d}(3)}  \tag{5}\\
\mathrm{D}_{3 \mathrm{~d}}\left(/ \mathrm{C}_{2}\right)=\mathrm{C}_{2} \mathrm{E}+\mathrm{C}_{2} \mathrm{C}_{2(2)}+\mathrm{C}_{2} \mathrm{C}_{2(3)}+\mathrm{C}_{2} \mathrm{i}+\mathrm{C}_{2} \mathrm{~S}_{6}+\mathrm{C}_{2} \mathrm{~S}_{6}{ }^{5}  \tag{6}\\
\mathrm{D}_{3 \mathrm{~d}}\left(/ \mathrm{C}_{\mathrm{s}}\right)=\mathrm{C}_{\mathrm{s}} \mathrm{E}+\mathrm{C}_{5} \mathrm{C}_{3}+\mathrm{C}_{\mathrm{s}} \mathrm{C}_{3}^{2}+\mathrm{C}_{5} \mathrm{C}_{2(1)}+\mathrm{C}_{\mathrm{s}} \mathrm{C}_{2(2)}+\mathrm{C}_{\mathrm{s}} \mathrm{C}_{2(3)}  \tag{7}\\
\mathrm{D}_{3 \mathrm{~d}}\left(/ \mathrm{C}_{\mathrm{i}}\right)=\mathrm{C}_{\mathrm{i}} \mathrm{E}+\mathrm{C}_{\mathrm{i}} \mathrm{C}_{3}+\mathrm{C}_{\mathrm{i}} \mathrm{C}_{3}^{2}+\mathrm{C}_{\mathrm{i}} \mathrm{C}_{2(1)}+\mathrm{C}_{\mathrm{i}} \mathrm{C}_{2(2)}+\mathrm{C}_{\mathrm{i}} \mathrm{C}_{2(3)}  \tag{8}\\
\mathrm{D}_{3 \mathrm{~d}}\left(/ \mathrm{C}_{3}\right)=\mathrm{C}_{3} \mathrm{E}+\mathrm{C}_{3} \mathrm{C}_{2(1)}+\mathrm{C}_{3} \mathrm{~S}_{6}+\mathrm{C}_{3} \sigma_{\mathrm{d}(1)}  \tag{9}\\
\mathrm{D}_{3 \mathrm{~d}}\left(/ / \mathrm{C}_{2 \mathrm{~h}}\right)=\mathrm{C}_{2 \mathrm{~h}} \mathrm{E}+\mathrm{C}_{2 \mathrm{~h}} \mathrm{C}_{3}+\mathrm{C}_{2 \mathrm{~h}} \mathrm{C}_{3}^{2}  \tag{10}\\
\mathrm{D}_{3 \mathrm{~d}}\left(/ \mathrm{D}_{3 \mathrm{~d}}\right)=\mathrm{D}_{3} \mathrm{E}+\mathrm{D}_{3} \mathrm{~S}_{6}  \tag{11}\\
\mathrm{D}_{3 \mathrm{~d}}\left(/ \mathrm{C}_{3 \mathrm{v}}\right)=\mathrm{C}_{3 \mathrm{v}} \mathrm{E}+\mathrm{C}_{3 \mathrm{v}} \mathrm{C}_{2(1)}  \tag{12}\\
\mathrm{D}_{3 \mathrm{~d}}\left(/ / \mathrm{S}_{6}\right)=\mathrm{S}_{6} \mathrm{E}+\mathrm{S}_{6} \mathrm{C}_{2(1)}  \tag{13}\\
\mathrm{D}_{3 \mathrm{~d}}\left(/ \mathrm{D}_{3 \mathrm{~d}}\right)=\mathrm{D}_{3 \mathrm{~d}} \mathrm{E} \tag{14}
\end{gather*}
$$

To permute the elements of each CR, we multiply the right hand side terms of Eqs. 5-14 by each symmetry operation of $\mathrm{D}_{3 \mathrm{~d}}$. Such operations allow obtaining a row vector of marks (i.e. numbers of invariant elements) assign to each CR. The ten row vectors of marks generated by these operations form the table of marks for $\mathrm{D}_{3 \mathrm{~d}}$ denoted $\mathrm{M}_{\mathrm{D}_{3 \mathrm{~d}}}$ given hereafter:

$$
\mathrm{M}_{\mathrm{D}_{34}}=\left(\begin{array}{cccccccccc}
12 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\
6 & 2 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\
6 & 0 & 2 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\
6 & 0 & 0 & 6 & 0 & 0 & 0 & 0 & 0 & 0 \\
4 & 0 & 0 & 0 & 4 & 0 & 0 & 0 & 0 & 0 \\
3 & 1 & 1 & 3 & 0 & 1 & 0 & 0 & 0 & 0 \\
2 & 0 & 2 & 0 & 2 & 0 & 2 & 0 & 0 & 0 \\
2 & 2 & 0 & 0 & 2 & 0 & 0 & 2 & 0 & 0 \\
2 & 0 & 0 & 2 & 2 & 0 & 0 & 0 & 2 & 0 \\
1 & 1 & 1 & 1 & 1 & 1 & 1 & 1 & 1 & 1
\end{array}\right)
$$

The inverse of this mark table denoted $\mathrm{M}_{\mathrm{D}_{3 \mathrm{~d}}}^{-1}$ is derived from Eq. 15 :

$$
\begin{equation*}
\mathrm{M}_{\mathrm{D}_{3 \mathrm{~d}}} \times \mathrm{M}_{\mathrm{D}_{3 \mathrm{~d}}^{-1}}^{-1}=\mathrm{I} \tag{15}
\end{equation*}
$$

where I represents the $10 \times 10$ identity matrix.

$$
\mathrm{M}_{\mathrm{D}_{3 d}}^{-1}=\left(\begin{array}{cccccccccc}
\frac{1}{12} & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\
-\frac{1}{4} & \frac{1}{2} & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\
-\frac{1}{4} & 0 & \frac{1}{2} & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\
-\frac{1}{12} & 0 & 0 & \frac{1}{6} & 0 & 0 & 0 & 0 & 0 & 0 \\
-\frac{1}{12} & 0 & 0 & 0 & \frac{1}{6} & 0 & 0 & 0 & 0 & 0 \\
\frac{1}{2} & -\frac{1}{2} & -\frac{1}{2} & -\frac{1}{2} & 0 & 1 & 0 & 0 & 0 & 0 \\
\frac{1}{4} & 0 & -\frac{1}{2} & 0 & -\frac{1}{4} & 0 & \frac{1}{2} & 0 & 0 & 0 \\
\frac{1}{4} & -\frac{1}{2} & 0 & 0 & -\frac{1}{4} & 0 & 0 & \frac{1}{2} & 0 & 0 \\
\frac{1}{12} & 0 & 0 & -\frac{1}{6} & -\frac{1}{4} & 0 & 0 & 0 & \frac{1}{2} & 0 \\
-\frac{1}{2} & \frac{1}{2} & \frac{1}{2} & \frac{1}{2} & \frac{1}{2} & -1 & -\frac{1}{2} & -\frac{1}{2} & -\frac{1}{2} & 1
\end{array}\right)
$$

To assign an appropriate CR to $\Delta_{1}, \Delta_{2}$ and $\Delta_{3}$, we find the largest subgroup that keeps the elements of each orbit invariant. The elements of $\Delta_{1}$ are invariant under the $\mathrm{C}_{3 \mathrm{v}}$ subgroup action and similarly those of the orbits $\Delta_{2}$ and $\Delta_{3}$ are kept unchanged by $C_{s}$. The coset representation assigned to $\Delta_{1}$ is therefore $\mathrm{D}_{3 \mathrm{~d}}\left(/ \mathrm{C}_{3 \mathrm{v}}\right)$ and that one governing $\Delta_{2}$ and $\Delta_{3}$ is denoted $\mathrm{D}_{3 \mathrm{~d}}\left(/ \mathrm{C}_{\mathrm{s}}\right)$.

## RESULTS AND DISCUSSION

In this work, we have used Fujita's ${ }^{10-15}$ mathematical approach to calculate the subduction of coset representations $D_{3 d}\left(/ C_{3 v}\right)$ and $D_{3 d}\left(/ C_{s}\right)$ by all subgroups of $D_{3 d}$. These operations are symbolized by Eq. 16-18:

$$
\begin{gather*}
D_{3 \mathrm{~d}}\left(/ \mathrm{C}_{3 \mathrm{v}}\right) \downarrow \mathrm{G}_{\mathrm{i}}=\beta_{\mathrm{ij}} \mathrm{G}_{\mathrm{i}}\left(/ \mathrm{G}_{\mathrm{j}}\right)  \tag{16}\\
\mathrm{D}_{3 \mathrm{~d}}\left(/ \mathrm{C}_{\mathrm{s}}\right) \downarrow \mathrm{G}_{\mathrm{i}}=\beta_{\mathrm{ik}} \mathrm{G}_{\mathrm{i}}\left(/ \mathrm{G}_{\mathrm{k}}\right)  \tag{17}\\
\mathrm{D}_{3 \mathrm{~d}}\left(/ \mathrm{C}_{\mathrm{s}}\right) \downarrow \mathrm{G}_{\mathrm{i}}=\beta_{\mathrm{ij}} \mathrm{G}_{\mathrm{i}}\left(/ \mathrm{G}_{\mathrm{j}}\right)+\beta_{\mathrm{il}} \mathrm{G}_{\mathrm{i}}\left(/ \mathrm{G}_{\mathrm{l}}\right) \tag{18}
\end{gather*}
$$

where $\left(G_{i}, G_{k}, G_{1}\right) \in \operatorname{SSG}_{D_{3 d}}$. Then the right hand side terms of Eqs. 16-18 are transformed into unit subduced cycle indices (USCIs) $S_{d_{i}}^{\beta_{i}}, f_{d_{i}}^{\beta_{i}}$ and $f_{d_{i j}}^{\beta_{i j}} \times f_{d_{i l}}^{\beta_{i l}}$ given in Eqs. 19-21, respectively.

$$
\begin{gather*}
D_{3 \mathrm{~d}}\left(/ \mathrm{C}_{3 \mathrm{v}}\right) \downarrow \mathrm{G}_{\mathrm{i}}=\beta_{\mathrm{ij}} \mathrm{G}_{\mathrm{i}}\left(/ \mathrm{G}_{\mathrm{j}}\right) \rightarrow \mathrm{S}_{\mathrm{d}_{\mathrm{ij}}}^{\beta_{\mathrm{ij}}} \text { for } \Delta_{1}  \tag{19}\\
\mathrm{D}_{3 \mathrm{~d}}\left(/ \mathrm{C}_{\mathrm{s}}\right) \downarrow \mathrm{G}_{\mathrm{i}}=\left\{\begin{array}{c}
\beta_{\mathrm{ir}} G_{\mathrm{i}}\left(/ \mathrm{G}_{\mathrm{r}}\right) \rightarrow \mathrm{f}_{\mathrm{d}_{\mathrm{ir}}}^{\beta_{\mathrm{ir}}} \\
\left.\beta_{\mathrm{ik}} G_{\mathrm{i}}\left(/ \mathrm{G}_{\mathrm{k}}\right)+\beta_{\mathrm{il}} \mathrm{G}_{\mathrm{i}} / / \mathrm{G}_{1}\right) \rightarrow \mathrm{f}_{\mathrm{d}_{\mathrm{ir}}}^{\beta_{\mathrm{ij}}} f_{\mathrm{d}_{\mathrm{il}}}^{\beta_{\mathrm{i}}}
\end{array}\right\} \text { for } \Delta_{2} \tag{20}
\end{gather*}
$$

$$
\mathrm{D}_{3 \mathrm{~d}}\left(/ \mathrm{C}_{\mathrm{s}}\right) \downarrow \mathrm{G}_{\mathrm{i}}=\left\{\begin{array}{c}
\beta_{\mathrm{ir}} \mathrm{G}_{\mathrm{i}}\left(/ \mathrm{G}_{\mathrm{r}}\right) \rightarrow \mathrm{S}_{\mathrm{d}_{\mathrm{ir}}}^{\beta_{\mathrm{ir}}}  \tag{21}\\
\beta_{\mathrm{ik}} \mathrm{G}_{\mathrm{i}}\left(/ \mathrm{G}_{\mathrm{k}}\right)+\beta_{\mathrm{ill}} \mathrm{G}_{\mathrm{i}}\left(/ \mathrm{G}_{1}\right) \rightarrow S_{\mathrm{d}_{\mathrm{ir}}}^{\beta_{\mathrm{ik}}} S_{\mathrm{d}_{\mathrm{il}}}^{\beta_{\mathrm{i}}}
\end{array}\right\} \text { for } \Delta_{3}
$$

The superscripts $\beta_{\mathrm{ij}}, \beta_{\mathrm{ik}}, \beta_{\mathrm{ir}}$ and $\beta_{\mathrm{il}}$ in eqs. 16-21 are subduction's coefficients and the subscripts are derived from the ratios $\mathrm{d}_{\mathrm{ij}}=\frac{\left|\mathrm{G}_{\mathrm{i}}\right|}{\left|\mathrm{G}_{\mathrm{j}}\right|}$, dik $=\frac{\left|\mathrm{G}_{\mathrm{i}}\right|}{\left|\mathrm{G}_{\mathrm{k}}\right|}$, $\mathrm{d}_{\mathrm{ir}}=\frac{\left|\mathrm{G}_{\mathrm{i}}\right|}{\left|\mathrm{G}_{\mathrm{r}}\right|}$ and $\mathrm{d}_{\mathrm{il}}=\frac{\left|\mathrm{G}_{\mathrm{i}}\right|}{\left|\mathrm{G}_{\mathrm{l}}\right|}$, where $\left|\mathrm{G}_{\mathrm{i}}\right|,\left|\mathrm{G}_{\mathrm{j}}\right|,\left|\mathrm{G}_{\mathrm{k}}\right|,\left|\mathrm{G}_{\mathrm{k}}\right|,\left|\mathrm{G}_{\mathrm{r}}\right|$ and $\left|\mathrm{G}_{1}\right|$ are the cardinalities of the respective subgroups. The subductions and the USCIs obtained are reported in Table 1 for the orbits $\Delta_{1}, \Delta_{2}$ and $\Delta_{3}$. Note that global USCIs are derived from Eq. 22 :

$$
\begin{equation*}
S_{d_{i j}}^{\beta_{i j}+} \times S_{d_{i k}}^{\beta_{i k}} \times f_{d_{i l}}^{\beta_{i l}}=S_{d_{i j}}^{\beta_{i j}+\beta_{i k}} \times f_{d_{i l}}^{\beta_{i u}} \text { if } d_{i j}=d_{i k} \tag{22}
\end{equation*}
$$

For example the global USCI for the subsymmetry $\mathrm{C}_{1}$ is : $S_{1}^{2} \times f_{1}^{6} \times S_{1}^{6}=S_{1}^{8} f_{1}^{6}$

In order to solve our enumeration problem let us consider $\mathrm{L}=\{\mathrm{C}, \mathrm{N}, \mathrm{O}\}$ as a set of ligands to be put in distinct ways among the bridgehead and bridge positions of diamantane. According to the OMV restriction of the orbits we attribute to these ligands the following weights:

$$
\begin{aligned}
& \omega_{\Delta_{1}}(\mathrm{C})=1, \omega_{\Delta_{1}}(\mathrm{~N})=x \text { and } \omega_{\Delta_{1}}(\mathrm{O})=0 \text { for } \Delta_{1} \\
& \omega_{\Delta_{2}}(\mathrm{C})=1, \omega_{\Delta_{2}}(\mathrm{~N})=x \text { and } \omega_{\Delta_{2}}(\mathrm{O})=y \text { for } \Delta_{2} \\
& \omega_{\Delta_{3}}(\mathrm{C})=1, \omega_{\Delta_{3}}(\mathrm{~N})=x \text { and } \omega_{\Delta_{3}}(\mathrm{O})=0 \text { for } \Delta_{3}
\end{aligned}
$$

We have considered the following ligand inventories:

$$
\mathrm{S}_{\mathrm{d}}=1+\mathrm{x}^{\mathrm{d}} \text { for } \Delta_{1} \text { and } \Delta_{3}
$$

and

$$
\mathrm{f}_{\mathrm{d}}=1+\mathrm{x}^{\mathrm{d}}+\mathrm{y}^{\mathrm{d}} \text { for } \Delta_{2}
$$

To convert the global USCIs shown in table 2 into generating functions of type $F(x, y)$ related to each subsymmetry $\mathrm{G}_{\mathrm{i}} \subset \mathrm{D}_{3 \mathrm{~d}}$ as follows:

$$
\begin{equation*}
S_{d_{i j}}^{\beta_{i j}+} \times S_{d_{i k}}^{\beta_{i k}} \times f_{d_{i l}}^{\beta_{i l}} \rightarrow F(x, y)=\left(1+x^{d_{i j}}\right)^{\beta_{i j}}\left(1+x^{d_{i k}}\right)^{\beta_{i k}}\left(1+x^{d_{i l}}+y^{d_{i l}}\right)^{\beta_{i l}}=\sum_{q_{1}, q_{2}} A_{q_{1}, q_{2}} x^{q_{1}} y^{q_{2}} \tag{23}
\end{equation*}
$$

Table 2: Generating functions derived from global USCIs related to the subsymmetries of $\mathbf{D}_{3 \mathrm{~d}}$

| Subsymmetries | Global USCIs | Generating function $\boldsymbol{F}(\boldsymbol{x}, \boldsymbol{y})$ |

| $\mathrm{D}_{3}, \mathrm{~S}_{6}, \mathrm{D}_{3 \mathrm{~d}}$ | $S_{2}^{1} S_{6}^{1} f_{6}^{1}$ | $\left(1+x^{2}\right)\left(1+x^{6}\right)\left(1+x^{6}+y^{6}\right)$ |

The expansion of $F(x, y)$ yields for each term $x^{q_{1}} y^{q_{2}}$ the coefficients $A q_{1}, q_{2}$, which are collected to form a fixed point matrix FPM $\left(x^{q_{1}} y^{q_{2}}\right)$ shown below:

To obtain the isomer count matrix $\operatorname{ICM}\left(x^{q_{1}} y^{q_{2}}\right)$ we multiply FPM $\left(x^{q_{1}} y^{q_{2}}\right)$ by $M_{D_{3 d}}^{-1}$ the inverse of the mark table for $\mathrm{D}_{3 \mathrm{~d}}$ :

$$
\begin{equation*}
\operatorname{ICM}\left(x^{q_{1}} y^{q_{2}}\right)=F P M\left(x^{q_{1}} y^{q_{2}}\right) \times \mathrm{M}_{\mathbf{D}_{3 \mathrm{~d}}^{-1}} \tag{24}
\end{equation*}
$$

The rows and columns of the $\operatorname{ICM}\left(\mathrm{x}^{\mathrm{q}_{1}} \mathrm{y}^{\mathrm{q}_{2}}\right)$ are numbers of hetero diamantane isomers given with respect to the symmetry and the degrees of substitution $\mathrm{q}_{1}$ and $\mathrm{q}_{2}$. These results depict compounds where the diamantane carbon skeleton $\left(\mathrm{C}_{14}\right)$ has been transformed into $\mathrm{C}_{14-\mathrm{q}_{1}-\mathrm{q}_{2}} \mathrm{~N}_{\mathrm{q}_{1}} \mathrm{O}_{\mathrm{q}_{2}}$ and such series are presented in the right hand side of the ICM together with their corresponding mathematical expression $\left(x^{q_{1}} y^{q_{2}}\right)$ in the left hand side.

It should be noted that for $\mathrm{q}_{2}=0$ the rows $\left(\mathrm{x}^{\mathrm{q}_{1}}\right)$ present the isomers numbers of azadiamantane series symbolized by the empirical formula $\mathrm{C}_{14-\mathrm{q}_{1}} \mathrm{~N}_{\mathrm{q}_{1}}$. The calculations reveal that substitution under the OMV restriction of C atoms by N atoms among 8 bridgehead positions of diamantane skeleton generates for:

$$
\begin{aligned}
& \mathrm{q}_{1}=1 \rightarrow 1 \mathrm{C}_{\mathrm{s}}+1 \mathrm{C}_{3 \mathrm{v}}\left(\mathrm{C}_{13} \mathrm{~N}\right) \\
& \mathrm{q}_{1}=2 \rightarrow 2 \mathrm{C}_{1}+2 \mathrm{C}_{2}+8 \mathrm{C}_{\mathrm{s}}+2 \mathrm{C}_{2 \mathrm{~h}}+1 \mathrm{D}_{3 \mathrm{~d}}\left(\mathrm{C}_{12} \mathrm{~N}_{2}\right) \\
& \mathrm{q}_{1}=3 \rightarrow 20 \mathrm{C}_{1}+20 \mathrm{C}_{\mathrm{s}}+2 \mathrm{C}_{3 \mathrm{v}}\left(\mathrm{C}_{11} \mathrm{~N}_{3}\right) \\
& \mathrm{q}_{1}=4 \rightarrow 60 \mathrm{C}_{1}+8 \mathrm{C}_{2}+34 \mathrm{C}_{\mathrm{s}}+1 \mathrm{C}_{\mathrm{i}}+5 \mathrm{C}_{2 \mathrm{~h}}+4 \mathrm{C}_{3 \mathrm{v}}\left(\mathrm{C}_{10} \mathrm{O}_{4}\right)
\end{aligned}
$$

For the sake of illustration figure 2 depicts chemical graphs of 3 mono and 15 di-azadiamantane skeletons predicted by the pattern inventory.

$$
q_{1}=1 \rightarrow 2 C_{s}+1 C_{3 v}\left(\mathbf{C}_{\mathbf{1 3}} \mathbf{N}\right)
$$

$$
q_{1}=2 \rightarrow 2 C_{1}+2 C_{2}+8 C_{s}+2 C_{2 h}+1 D_{3 d}\left(\mathbf{C}_{\mathbf{1 2}} \mathbf{N}_{\mathbf{2}}\right)
$$

Fig. 2: Chemical graphs of mono- and di-azadiamantane derivatives

In the other hand, the substitution under the OMV restriction of C atoms by O atoms among 6 bridge positions of diamantane skeleton (see rows $\left(\mathrm{y}^{\mathrm{q}_{2}}\right)$ ) generates for :

$$
\begin{aligned}
& \mathrm{q}_{2}=1 \rightarrow 1 \mathrm{C}_{\mathrm{s}}\left(\mathrm{C}_{13} \mathrm{O}\right) \\
& \mathrm{q}_{2}=2 \rightarrow 1 \mathrm{C}_{2}+1 \mathrm{C}_{\mathrm{s}}+1 \mathrm{C}_{2 \mathrm{~h}}\left(\mathrm{C}_{12} \mathrm{O}_{2}\right) \\
& \mathrm{q}_{2}=3 \rightarrow 1 \mathrm{C}_{1}+1 \mathrm{C}_{\mathrm{s}}+1 \mathrm{C}_{2 \mathrm{H}}\left(\mathrm{C}_{11} \mathrm{O}_{3}\right) \\
& \mathrm{q}_{2}=4 \rightarrow 1 \mathrm{C}_{2}+1 \mathrm{C}_{\mathrm{s}}+1 \mathrm{C}_{2 \mathrm{~h}}\left(\mathrm{C}_{10} \mathrm{O}_{4}\right)
\end{aligned}
$$

Fig. 3 depicts chemical graphs of 1 mono, 3 di-, 3 tri- and 3 tetra- oxadiamantanes analogs $\mathrm{C}_{14-\mathrm{q}_{2}} \mathrm{O}_{\mathrm{q}_{2}}$.

$$
\mathrm{q}_{2}=1 \rightarrow 1 \mathrm{C}_{\mathrm{s}}\left(\mathrm{C}_{13} \mathrm{O}\right)
$$

$\mathrm{q}_{2}=3 \rightarrow 1 \mathrm{C}_{1}+1 \mathrm{C}_{\mathrm{s}}+1 \mathrm{C}_{2 \mathrm{H}}\left(\mathrm{C}_{11} \mathrm{O}_{3}\right)$

Fig. 3: Graphs of mono-, di, tri and tetraoxa-diamantanes with their respective symmetry
The simultaneous substitutions under the OMV restriction of C atoms by N and O atoms among 8 bridgehead and 6 bridge positions of diamantane skeleton (see rows $\left(x^{q_{1}} y^{q_{2}}\right)$ ) generate for $q_{1}=1$ and $q_{2}=1$, 9 oxa-aza-diamantanes $\left(\mathrm{C}_{12} \mathrm{NO}\right)$ including $4 \mathrm{C}_{1}+5 \mathrm{C}_{\mathrm{s}}$ (see Fig. 4).

$$
\mathrm{q}_{1}=1, \mathrm{q}_{2}=1 \rightarrow 4 \mathrm{C}_{1}+5 \mathrm{C}_{\mathrm{s}}\left(\mathrm{C}_{12} \mathrm{NO}\right)
$$

Fig. 4: Chemical graphs of $4 C_{1}$ and $5 C_{\mathrm{s}}$ oxa-aza diamantane analogs
In the case where $\mathrm{q}_{1}=\mathrm{q}_{2}=2$ the calculations have predict :

$$
66 \mathrm{C}_{1}+8 \mathrm{C}_{2}+22 \mathrm{C}_{\mathrm{s}}+2 \mathrm{C}_{\mathrm{i}}+2 \mathrm{C}_{2 \mathrm{~h}}
$$

Dioxa-diaza diamantanes $\left(\mathrm{C}_{10} \mathrm{~N}_{2} \mathrm{O}_{2}\right)$. Fig. 5 presents for illustration chemical graphs for $2 C_{i}, 2 C_{2 h}$ and $8 C_{2}$ diamantane analog skeletons.

Fig. 5: Chemical graphs of $2 C_{i}, 2 C_{2 h}$ and $8 C_{2}$ dioxa-diaza diamantane analogs

## CONCLUSION

The pattern inventory presented in this study is applicable to the enumeration of series of heterocyclic aza-, oxa- and oxa-aza-diamantane skeletons symbolized by the general empirical formula $\mathrm{C}_{14-\mathrm{a}_{1}-\mathrm{q}_{2}} \mathrm{Nq}_{\mathrm{q}_{1}} \mathrm{Oq}_{\mathrm{q}_{2}}$. The results have shown that for fixed values of the degrees of substitutions $\mathrm{q}_{1}$ and $\mathrm{q}_{2}$ the
numbers of heterocyclic isomers of aza-diamantane $\left(\mathrm{C}_{14-\mathrm{q}_{1}} \mathrm{~N}_{\mathrm{q}_{1}}\right)$ is higher than the number of oxadiamantane $\left(\mathrm{C}_{14-\mathrm{q}_{2}} \mathrm{O}_{\mathrm{q}_{2}}\right)$ while a combined substitutions producing oxa-aza-diamantane analogs yields numbers of isomers intermediate to those of the 2 aforementioned series. These differences results from the OMV restriction. It is to be noticed that the sum of isomers numbers in each row of the ICM match up with the polya's coefficients ${ }^{16}$ obtained from the direct subduction method presented in part II of this study.
