ABSTRACT

In this paper, let $M^n$ be a n-dimensional submanifold without umbilical point on unit sphere $S^k$, we use some Moebius invariants to get two pinching theorems about the Moebius sectional curvature, which give the characterizations of Veronese submanifolds and Clifford tori.

KEYWORDS

Conformal submanifold; Moebius sectional curvature; Moebius invariants.
INTRODUCTION

Let $M^n$ be a n-dimensional submanifold without umbilical point on unit sphere $S^n$, Wang [1] using conformal differential geometry to establish the theory of conformal differential geometry of submanifolds, and give the classification of the vanishing Moebius form in unit sphere $S^3$. Submanifolds are obtained fully invariant system under the conformal group. Many conformal submanifolds in differential geometry was classified completely (cf.[2-7]), which apply the invariant system---Moebius form, Moebius second fundamental form B, Blaschake tensor A, and then submanifold of unit sphere $S^n$ is given a number of important Moebius characters. In this paper, we prove two Moebius sectional curvature pinching theorems, which give the characterizations of Clifford tori and Veronese submanifolds by the Moebius invariants.

Orthonormal frame field and Riemannian curvature. Let $M$ be a n-dimensional Riemannian manifold, $e_1, e_2, \ldots, e_n$ a local orthonormal frame field on $M$, and $\omega_1, \omega_2, \ldots, \omega_n$ is its dual frame field. Then the structure equation of $M$ are given by:

$$
\omega_i = \sum_j \omega_j \wedge \omega_{ji}, \quad \omega_{ij} = -\omega_{ji}
$$

(1)

$$
\omega_k = \sum_\alpha \omega_\alpha \wedge \omega_k - \frac{1}{2} \sum_{k,l} R_{ijk} \omega_\alpha \wedge \omega_k
$$

(2)

where $\omega_{ij}$ is the Levi-civita connection and $R_{ijk}$ the Riemannian curvature tensor of $M$. Ricci tensor $R_g$ and scalar curvature are defined respectively by

$$
R_g := \sum_k R_{kk}, \quad r := \sum_k R_{kk}
$$

(3)

MOEBIUS INVARIANTS

Let $R_{n+2}$ is a n+2-dimentional Lorentzian space,

$$
X = (x_0, x_1, \ldots, x_{n+1}), \quad Y = (y_0, y_1, \ldots, y_{n+1})
$$

define $<X, Y> = -x_0y_0 + x_1y_1 + \ldots + x_{n+1}y_{n+1}$

(4)

Let $x : M^n \to S^n$ is an Immersed submanifolds without umbilical point on unit sphere, and position vector $Y = \rho(1, x)$,

$$
\rho^2 = \frac{m}{m-1} (\|H\|^2 - mH^2)
$$

(5)

then $g = <dY, dY> = \rho^2 dx \cdot dx$ is Moebius invariants.

In the unit sphere, let $\{e_1, e_2, \ldots, e_m\}$ a local orthonormal frame field on $M$, and $\{\omega_1, \omega_2, \ldots, \omega_m\}$ is its dual frame field. where $1 \leq i,j,k,l, \ldots \leq m$; $m+1 \leq \alpha, \beta, \ldots, \leq m+p = n$, then

$$
A = \sum_{i,j} A_{ij} \omega_i \wedge \omega_j, \quad B = \sum_{i,j,\alpha} B_{ij}^\alpha \omega_i \wedge \omega_j E_\alpha, \quad \phi = \sum_{i,\alpha} C_{i}^\alpha \omega_j E_\alpha
$$
where A is Blaschake tensor, B is Moebius form, $\phi$ is Moebius second fundamental form, then we get the equation as follows:

$$A_{ij,k} - A_{ik,j} = \sum_{\alpha} (B_{ik}^\alpha C_j^\alpha - B_{ij}^\alpha C_k^\alpha) \quad (6)$$

$$C_{i,j}^\alpha - C_{j,i}^\alpha = \sum_k (B_{ij}^\alpha A_{ki} - B_{ki}^\alpha A_{ij}) \quad (7)$$

$$B_{ij,k}^\alpha - B_{ik,j}^\alpha = \delta_{jk} C_k^\alpha - \delta_{ik} C_j^\alpha \quad (8)$$

$$R_{ijkl} = \sum_{\alpha} (B_{jk}^\alpha B_{ij}^\alpha - B_{il}^\alpha B_{ij}^\alpha) + A_{ik} \delta_{jl} + A_{jl} \delta_{ik} - A_{ij} \delta_{ik} - A_{jk} \delta_{il} \quad (9)$$

$$\sum_i B_{ii}^\alpha = 0, \quad trA = \frac{1 + m^2 R}{2m}, \quad \sum_{i,j} (B_{ij}^\alpha)^2 = \frac{m-1}{m}, \quad R = \frac{1}{m(m-1)} \sum_{i,j} R_{ij} \quad (10)$$

where $R_{ijkl}$ is the Riemannian curvature tensor of M, $R$ is the normal Moebius scalar curvature of M.

**PINCHING THEOREMS**

Lemma 1 Let $x : M^m \rightarrow S$ is submainfolds without umbilical point on $S^n$, $\forall a \in R^1$

$$0 = \frac{1}{2} \Delta \|B\|^2 = \|\nabla B\|^2 + (1 + a) \sum_{i,j,\alpha, i,k} B_{ij}^\alpha (B_{ik}^\alpha R_{ijk} + B_{\alpha}^\alpha R_{ij\alpha} - \frac{(m-1)a}{m} trA$$

$$+ a \sum_{\alpha} tr(B_{\alpha}^\alpha \nabla \phi_\alpha) - (1 - a) \sum_{\alpha, \beta} [tr(B_{\alpha}^\alpha B_{\beta}^\beta) - tr(B_{\alpha}^\alpha B_{\alpha}^\beta)] + a \sum_{\alpha, \beta} [tr(B_{\alpha}^\alpha B_{\beta}^\beta)]^2 - ma \sum_{\alpha} tr(AB_{\alpha}^\alpha) \quad \text{Lemma 2}$$

$$2\sum_{\alpha, \beta} [tr(B_{\alpha}^\alpha B_{\beta}^\beta) - tr(B_{\alpha}^\alpha B_{\beta}^\beta)]^2 + \sum_{\alpha, \beta} [tr(B_{\alpha}^\alpha B_{\beta}^\beta)]^2 \leq [1 + \frac{1}{2} \text{sgn}(p-1)] \|B\|^4 \quad (11)$$

if and only if

(i) $p = 1$

or (ii) $p = 2$, $B^{m+1}$, $B^{m+2}$ at the same time as

$$\lambda \overline{B}^{m+1}, \mu \overline{B}^{m+2}, \lambda^2 = \mu^2$$

$$\overline{B}^{m+1} = \begin{bmatrix} 0 & 1 & 0 & \ldots & 0 \\ 1 & 0 & 0 & \ldots & 0 \\ 0 & 0 & 0 & \ldots & 0 \\ \vdots & \vdots & \vdots & \ddots & \vdots \\ 0 & 0 & 0 & \ldots & 0 \end{bmatrix}, \quad \overline{B}^{m+2} = \begin{bmatrix} 1 & 0 & 0 & \ldots & 0 \\ 0 & -1 & 0 & \ldots & 0 \\ 0 & 0 & 0 & \ldots & 0 \\ \vdots & \vdots & \vdots & \ddots & \vdots \\ 0 & 0 & 0 & \ldots & 0 \end{bmatrix}$$
Theorem 1 Let \( x : M^m \rightarrow S^n \) \((n = m + p)\) is submainfolds without umbilical point in \( S^n \), \( K \) is the infimum of the sectional curvature, then
\[
K \leq \frac{m-1}{2m^2} \left[ 1 + \frac{1}{2} \text{sgn}(p-1) - \frac{1}{p} \right],
\]
if \( K \geq \frac{m-1}{2m^2} \left[ 1 + \frac{1}{2} \text{sgn}(p-1) - \frac{1}{p} \right], \)

\( x(M) \) is Moebius equivalent to a Versonese surface in \( S^4 \),
or is equivalent to Clifford tori in \( S^{m+1} \), \( S^k \left( \frac{k}{m} \right) \times S^{m-k} \left( \frac{m-k}{m} \right) (1 \leq k \leq m-1) \)

Theorem 2 Let \( x : M^m \rightarrow S^n \) \((n = m + p)\) is submainfolds without umbilical point in \( S^n \), \( K \) is infimum of the sectional curvature, \( D = A - \frac{1}{m} \text{tr} A \cdot \text{id} \), then
\[
K \leq \frac{m-2}{2(m+1)} \sqrt{\frac{m}{m-1}} \|D\| + \frac{1}{m+1} \text{tr} A, \text{ if } K \geq \frac{m-2}{2(m+1)} \sqrt{\frac{m}{m-1}} \|D\| + \frac{1}{m+1} \text{tr} A
\]

\( x(M) \) is Moebius equivalent to a Versonese surface \( S^m \left( \frac{2(m+1)}{m} \right) \).

Then, we prove the theorem.

Proof of Theorem 1

Let \( x : M^m \rightarrow S^n \) \((n = m + p)\) is an submainfads without umbilical point on unit sphere, \( K \) is the infimum of the sectional curvature, In Lemma 2, let \( a = 0 \), then
\[
0 = \|\nabla B\|^2 + \sum_{i,j,a\,,\,i,k} B^a_{i,j}(B^a_{i,k} R_{ijk} + B^a_{i,j} R_{ijk}) - \sum_{\alpha,\beta} \left[ \text{tr}(B^2 B^2) - \text{tr}(B^a B^a) \right]^2 \]

(12)

Because
\[
\sum_{i,j,a\,,\,i,k} B^a_{i,j}(B^a_{i,k} R_{ijk} + B^a_{i,j} R_{ijk}) \geq mK \|B\|^2, \quad \frac{\|B\|^4}{p} \leq \sum_{\alpha,\beta} \left[ \text{tr}(B^a B^a) \right]^2 \leq \|B\|^4
\]

(13)

then
\[
0 \geq \|\nabla B\|^2 + mK \|B\|^2
\]

\[-\frac{1}{2} \left( 2 \sum_{\alpha,\beta} \left[ \text{tr}(B^2 B^2) - \text{tr}(B^a B^a) \right]^2 + \sum_{\alpha,\beta} \left[ \text{tr}(B^a B^a) \right]^2 \right) + \frac{1}{2} \sum_{\alpha,\beta} \left[ \text{tr}(B^a B^a) \right]^2 \]

\[
\geq \|\nabla B\|^2 + mK \|B\|^2 - \frac{1}{2} \left[ 1 + \frac{1}{2} \text{sgn}(p-1) \right] \|B\|^4 + \frac{1}{2p} \|B\|^4
\]

(14)

Because \( \|\nabla B\|^2 \geq 0 \), Then
\[
K - \frac{m-1}{2m^2}[1 + \frac{1}{2}\text{sgn}(p-1) - \frac{1}{p}] \leq 0
\]  
(15)

If \( K \geq \frac{m-1}{2m^2}[1 + \frac{1}{2}\text{sgn}(p-1) - \frac{1}{p}] \), then

\[
K = \frac{m-1}{2m^2}[1 + \frac{1}{2}\text{sgn}(p-1) - \frac{1}{p}]
\]  
(16)

Because \( \|\nabla B\| = 0 \), \( \phi = 0 \), according to the lemma 1, we get the following,

(i) \( p = 1 \), \( K = 0 \), \( x(M) \) is Moebius equivalent to a Clifford minimal tori

\[
S^k(\sqrt{k/m}) \times S^{m-k}(\sqrt{(m-k)/m}) \text{ (i) } 1 \leq k \leq m-1 \text{ in } S^{m+1},
\]

(ii) \( p = 2 \), \( K = 1/8 \), \( x(M) \) is Moebius equivalent to a Versenese surface in \( S^d \)

Proof of Theorem 2

Let \( x: M^n \rightarrow S^n (n = m + p) \) is an submanifolds without umbilical point on unit sphere, \( K \) is the infimum of the sectional curvature, in Lemma 1, let \( a = m/(m + 2) \), from (13) and

\[
|trDB^2| \leq \frac{m-2}{\sqrt{m(m-1)}}\|D\|
\]

We obtain

\[
\frac{2(m+1)m}{m+2}K - \frac{m}{m+2} \cdot \frac{m(m-2)}{\sqrt{m(m-1)}}\|D\| - \frac{2m}{m+2}trA \leq 0
\]

(17)

Then

\[
K \leq \frac{m-2}{2(m+1)}\|D\| + \frac{1}{m+1}trA
\]

(18)

If \( K \geq \frac{m-2}{2(m+1)}\|D\| + \frac{1}{m+1}trA \)

Then

\[
K = \frac{m-2}{2(m+1)}\|D\| + \frac{1}{m+1}trA
\]

(19)

From \( \|\nabla B\| = 0 \) we obtain \( \phi = 0 \),

Let \( \{e_1, e_2, \cdots, e_m\} \) is a local standard orthogonal basis on TM, \( A_{ij} = \lambda_i \delta_{ij}, D_{ij} = \bar{\lambda}_i \delta_{ij} \),

From (17) take the equal sign, get all the \( \lambda_i \) is equal to each other,
let $\lambda_2 = \ldots = \lambda_m$, then $\tilde{\lambda}_2 = \ldots = \tilde{\lambda}_m$.

Then, we let

$$B_{11} = -(m - 1)\mu, \ B_{22} = \ldots = B_{mm} = \mu,$$

$$\tilde{\lambda}_1 = \frac{m - 1}{m} (\lambda_1 - \lambda), \ \tilde{\lambda}_2 = \ldots = \tilde{\lambda}_m = \frac{1}{m} (\lambda - \lambda_1)$$

$$\|D\| = \sqrt{\sum_i \tilde{\lambda}_i^2} = \frac{\sqrt{m(m-1)}}{m} |\lambda - \lambda_i| \tag{20}$$

from (6), we get

$$(m - 1)^2 \mu^2 + (m - 1)\mu = \frac{m - 1}{m}, \ \mu = \pm \frac{1}{m} \tag{21}$$

when $\alpha \geq 2$, $B_{1\alpha} = 0$

because $B_{11} \neq B_{\alpha\alpha}$, we obtain

$$\omega_{\epsilon 1} = 0$$

$$\sum_j B_{1\alpha,j} \omega_j = dB_{1\alpha} + \sum_j (B_{ij} \omega_{j\alpha} + B_{j\alpha} \omega_{j1}) = (B_{\alpha\alpha} - B_{11}) \omega_{\alpha 1} = 0 \tag{22}$$

$$\sum_{k,l} R_{\epsilon \alpha \alpha} \omega_k \wedge \omega_l = d\omega_{\epsilon \alpha} - \sum_k \omega_{\epsilon k} \wedge \omega_{\alpha k} = 0 \tag{23}$$

From (15)

$$0 = R_{1\alpha 1\alpha} = B_{11} B_{\alpha\alpha} + A_{11} + A_{\alpha\alpha} = -(m - 1)\mu^2 + \lambda_1 + \lambda \tag{24}$$

$$\lambda_1 + \lambda = \frac{m - 1}{m^2} \tag{25}$$

$$0 = \sum_j A_{1\alpha,j} \omega_j = dA_{1\alpha} + \sum_j A_{1j} \omega_{\alpha j} + \sum_j A_{\alpha j} \omega_{j1} = dA_{1\alpha} + (A_{11} - A_{\alpha\alpha}) \omega_{\alpha 1} \tag{26}$$

then $A_{1\alpha,j} = A_{1j,\alpha} = 0$ $A_{11,\alpha} = 0$, $A_{1\alpha,\alpha} = A_{\alpha\alpha,1} = 0$

$$A_{11} \omega_{\alpha} + \sum_{\alpha} A_{11,\alpha} \omega_{\alpha} = \sum_j A_{11,j} \omega_{\alpha} \ (2 \leq \alpha \leq m, 1 \leq j \leq m) \tag{27}$$

because of $0 = \sum_j A_{11,j} \omega_{\alpha} = dA_{11} + \sum_j A_{1j} \omega_{\alpha j} + \sum_j A_{j1} \omega_{j1} = dA_{11}$, we get $\lambda_1 = \text{const}$. 
If $\lambda \neq \lambda_1$ and $\omega_1 = \omega_2 = \ldots = \omega_m = 0$, assuming that $M^m = M_1^1 \times M_{m-1}^m$, $K=0$. From (19), we obtain $K = \frac{m-1}{2m(m+1)}$, which is contradiction with $K=0$, then $\lambda_1 = \lambda, \lambda_2 = \ldots = \lambda_m = 0$, $D=0$.

Then we obtain $R=K=1/[m(m+1)]$. $x(M)$ is Moebius equivalent to minimal submanifold in $S^n$, then $\rho^2 = \text{const}$, $A_{ij} = \delta_{ij}/2$. From $g = \rho^2 dx \cdot dx$, we get $K = \rho^{-2}K_E$ and $\rho^{-2} = 2tr(A)/m$. From $trA = (1 + m^2 R)/2m$, we get $\rho^2 = (1/m^2) + R$, $K_E = \frac{m}{2(m+1)}$, Then we obtain $\overline{M}$ is isometric to the Veronese surface $S^m(\sqrt{2(m+1)/m})$.
