Abstract

Synthesis of quinone has attracted considerable attention to scientific community due to presence in nature and for the construction of biologically active quinones homologs and other wide application. Thus this review describes the synthesis of common quinones such as 1,2-benzoquinone, 1,4-benzoquinones, 1,2-naphthoquinone and 1,4-naphthoquinone with covering almost all literature form the first synthesis of quinone.

Keywords: Quinone; Benzoquinone; Naphthoquinone; Anthraquinone; Oxidation; Oxidizing agents

Introduction

Quinone chromophore is present in a wide variety of natural products and drugs such as kinamycin, damavaricin, awamycin, [1] rifamycins, [2] streptovaricins, doxorubicin, mitoxanthone, streptonigrin, lavendamycin, menadione, lapachol [3] etc. and their derivatives have been used as key synthetic intermediates for construction of biologically active compounds associated with antitumor [4] antineoplastic [5] antifungal [6] antibacterial [7] antiviral [8] antimalarial and antitrypanosomal [10] activity. It is also an essential parts of various dyes such as naturally occurring alizarin dye [11] from madder plant.

The biological activity imparted by most of the quinones pertains to their ability to accept one significant role in quinones to accept electrons [11]. One or two electrons in order to form radical anion or dianion species. The electron donating or withdrawing substituents present in quinone play significance role in biological activity as well as in dyeing.

Various reviews had been reported the synthesis of substituted quinones which had covered the synthesis of a selected quinones with their applications for a specific time durations [13,14]. A literature survey revealed that there are no such reviews or book had published which cover the synthesis of a basic quinones in more than hundred year time duration.

Due to presence in nature [1-3] various drugs and dyes, quinones are used for the synthesis of various useful synthetic molecules and considerable attention have evoked chemists to probe the chemistry of quinones.

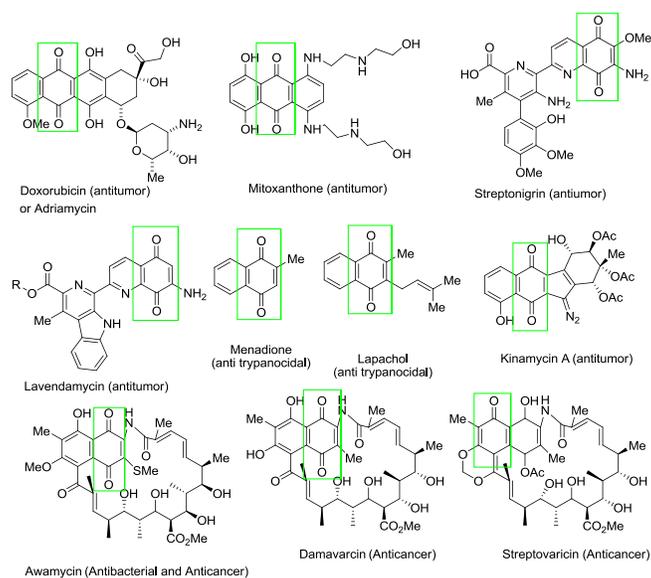

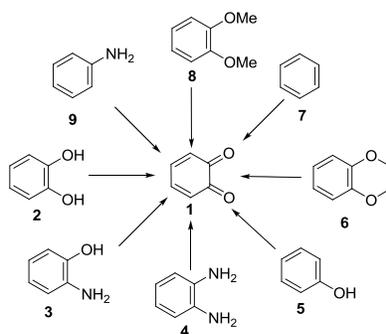

Figure 1: Naturally occurring quinones.

Our aim of this review is to cover various oxidizing agents with their reaction conditions. Thus, various strategies applied for the synthesis of quinones cited in various literatures have been discussed in this review.

Except AgO, 1,2-benzoquinone were also synthesized from pyrocatechol (2) using diversified oxidizing agents such as tetrabutylammonium chromate (TBAD) [16] polymer supported peroxotungstate complex (Amb)₂(W₂O₃(O₂)₄) [17] Ag₂O [18]. Polymer supported anionic peroxomolybdenum complexes (Amb)₂(Mo₂O₃(O₂)₄) [19] MnO₂ [20] barium ferrate monohydrate (BaFeO₄.H₂O), [21] bis[trinitrato cerium (IV)] chromate [Ce(NO₃)₃]₂CrO₄, [22] isoquinolinium bromochromate, [23] O₂ in Cu(OH)₂ [24] ammonium persulfate ((NH₄)₂S₂O₈) in wet SiO₂ [25] NaBO₃ in wet montmorillonite [Ce(NO₃)₃]₂CrO₄, [26] CF₃COOH ("Pfitzner-Moffatt" technique) [27] cetyltrimethyl ammonium cerium nitrate [28] H₂O₂ with vanadium substituted keggins heteropoly acid [29] H₂O₂ with "sandwich" type substituted

polyoxometalates Keggin heteropoly acid [30] Ag₂O [31] (Table 1 and Scheme 1).

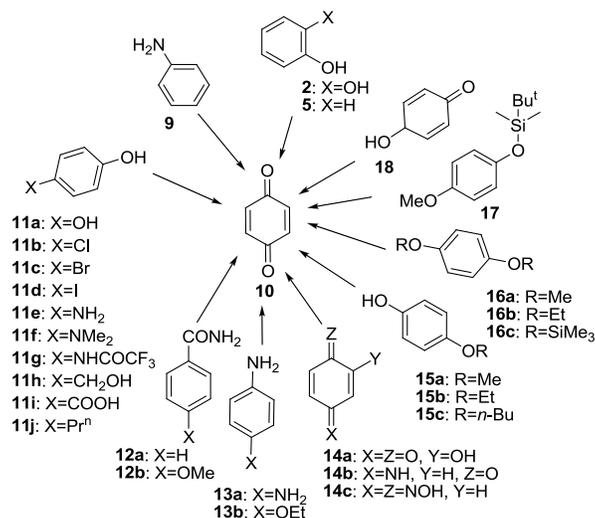

Synthesis of 1,2-benzoquinone (**1**) was also reported from the 2-aminophenol (**3**) using oxidizing agent viz. hypochlorite supported on dowex 1X8-200 [32] or MnO₂/HNO₃ [33]. Benzene-1,2-diamine (**4**) was also converted in 1,2-benzoquinone (**1**) from using oxidizing agent NaOCl/CH₂Cl₂.³² A oxo complex of ruthenium (IV)[35], O₂ with CuSO₄/NaCl.[36]

K₂(SO₃)₂NO with KH₂PO₄ were used to convert phenol (**5**) in 1,2-benzoquinone (**1**). 2,3-dihydrobenzo [*b*] [1,4] dioxine was converted in 1,2-benzoquinone (**1**) from O₃ with O₂ in CH₂Cl₂. [38] *tert*-Butylhydroperoxide (*t*-BuOOH) catalyzed with [Ru^{III}(amp)(bipy)(H₂O)]⁺ complex was used for the synthesis of 1,2-benzoquinone (**1**) and 1,4-benzoquinone (**10**) from benzene (**7**). [39]

It was also reported that 1,2-dimethoxybenzene (**8**) decomposed in 1,2-benzoquinone (**1**) in the presence of K with dibenzo-18-crown-6 ether[40] and aniline (**9**) was also converted in 1,2-benzoquinone (**1**) from periodate in acetic acid [41].

3. Synthesis of 1,4-Benzoquinone

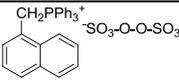

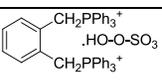

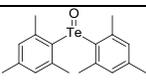

Synthesis of 1,4-benzoquinone or *p*-benzoquinone (**10**) was first reported from the oxidation of hydroquinone (**11a**) with Na₂Cr₂O₇ in H₂SO₄ in 1922 by Vilet [42] (Scheme 2 and Table 2).
