**ABSTRACT**

Since ancient time man has adopted several type of remedies from nature, a review of literature reveals that from tinniest herb to tallest tree or the climber are one or the other way useful in human or animal therapy. A pioneering work was done by our Saints Charak, Shushrut and several others, which was collected in the form of vedas (Rigveda, Ayurveda) Samhita, Nighantu and Aryabhisak. Work was done by several scientists around the world which led to compilation of information with regard to Occurrence, Identification, Chemical constitution, and therapeutic properties of such drugs, particularly used in ayurvedic medicines. Now the great scope is there for the scientist regarding herbal therapeutics, lacks of plants have been investigated and now reinvestigation is carried out for there chemical composition and therapeutic properties as per discovery of different new diseases, *Peristrophe bicalyculata* (Retz-Nees) is reported to be the useful remedy for the treatment of Jaundice, Manoraegia, T.B, Antiseptic and Anti-venom agent in indigenous system of medicine. We have isolated several constituents but here will be discussing isolation and characterization of Phenolic constituents which were confirmed by folin and coecaltiaus reagent and then extracted and its antimicrobial activity was studied comparing it with standard allopathic drug.

**INTRODUCTION**

A verse from old literature Kashyap Samhita proclaims that the use of drugs derived from plants dates back to antiquity what at present we take may be in the crude or pure form in the treatment of the alleged disorders was for shadowed in the folk remedies of the olden days and are coded in literature by Ayurvedic pioneers like charak, shushrut, Agnivesh Vagbhatt, and several other followers, which was collected in the form of vedas (Rigveda, Ayurveda) Samhita, Nighantu and Aryabhisak.

The level of the concentration of the effective molecule (drug) is low but enough to cure the disease faster by Ayurvedic method of healing. Now the great scope is there for the scientist regarding herbal therapeutics, lakhs of plants have been investigated and now reinvestigation is carried out for there chemical composition (extraction of the active constitution) and therapeutic properties as per discovery of new diseases.

Some locally used preparations have been found to surpass the efficiency of the synthetic drug used for the same treatment. Few of the plants are soo much usefull that it can cure certain allopathically incurable diseases. Ayurveda is not a literature but (package of medication), a well developed science, it is a wholesome guide to live a healthy life.

Ayurveda has guided How to stay fit with using natural methods ie pathya, vipatya, ahar, vihara etc these all are written in the form of shlokas, in the literatures Veda, Nighantu, Samhita Aryabhishak by pioneers like Charak, Kashyap, Vagbhat Shushrut Sharangdhar and
several other Rishis. The goal of life is to die young as late as possible.

At present Life style disease like diabetes, allergies, insomnia, obesity has large impact in human life.

Desire of the aging population to stay young and healthy led to self medication and greater orientation towards preventive health care.

Pharmaceutical Companies switched over to Phytopharmaceuticals because the Ayurvedic medicines have lowest side effects.

Few of the diseases are such that they have no alternative other than ayurveda for epilepsy drug Mangrove (Excoecaria Aglocha)

Turmeric is used for Gastrointestinal System, anti spasmodic and anti flatulent Anti inflammatory Anti Rheumatism Antidiabetic, Anti carcinogenic even what we consider as unwanted i.e. The weeds also has medicinal value like Indian Todophyllum has Radio protection properties. Ginger Pipali and Asafoetida have potential to treat Gastric Ulcer. Sikakai has Saponin for hair washing but on reinvestigating it has cytotoxic activity against Fibrosarcoma Cells. Gokhru Destroys Melanoma Cell Lines in human beings.

Phyto pharmaceutical is the prevailing field. It is found that with increase in demand of the herbal medicine, they are commercially grown with help of the synthetic fertilizers and pesticides causes poisoning and hence its medicinal value decreases, so growing of the medicinal plants by following vedic method (Biovedic Agriculture) is must to be followed; which deals with using the knowledge of vedas for growing the plant ie Graha Naxatra, Time, Agnihotra Tantra Mantra, Yantra also influence the growth of plant which has been found scientifically in short use of cosmic relation for growth of plant will give the good variety of plant and will have good medicinal value Similarly use of the plants to cure the disease of the medicinal plant Vrikshayurveda is use of the plants (neem, tulsi, aloe, vasa, weeds) for healthy growth of the medicinal plant e.g. Aloe extract is used for fungus existing in cummin seed plant, similarly several other plants are used against the disease of the plants, not only microorganisms effect the health of plant but also the unrequired metal pollutants toxify plant hence the medicinal value also effected so for that Phytoremediation of the soil is done.

**SCIENTIFIC APPROACH**

We have selected the plant Peristrophe bicalyculatta (RetZNees) which was duly authenticated\(^1\)\(^2\)\(^3\) and then Extraction and identification of the active constituents which are plant metabolites, according to their composition, (alkaloids, glycosides, cortocosides, Essential oils Terpenoids, flavonoids, anthocyanins, steroids, vitamins, aminoacids, sugars, saponin etc.) and their effect over the microbes was done.

Plant description as in Adarsh Nighantu written by BAPALAL VAIDYA\(^6\)

**General features:**
- It is herbaceous, 3-4 feet in height, stems and branches usually 6 angled more or less hairy, rough in angles, leaves 2-3 inch by 1-1 ½ inch.
- Ovate, acuminate densely linoelate, less hairy above, base usually round, flowers in trichotomus cymes and large laks divaricate, bract beneath calyx-2, oppositely often very unequal. Flowers purple or rose coloured.
- It is useful in treatment of Jaundice, Typhoid, In Curing Deafness, it has Wound Healing Properties, Sedative, Tuberculosis.
- It is also useful as an ANTIDOTE\(^7\)\(^8\)\(^9\) against Snake Bite

**Preliminary investigation**\(^10\):

It was duly authenticated shade dried, pulverised,

to 60-80 mesh value solvent extracted with increasing polarity and were tested for the active constituents and ash analysis was carried out.

**Chemical extractive:**

The weight amount of the powdered material was successively extracted in a Soxhlet extractor with increase in polarity. This residue was weighed and per...

**Ash analysis**

20 gm of powered material was taken in silica crucible. This was incinerated in a muffle furnace at a temperature not exceeding 450°C until all carbon was removed. The crucible was cooled and ash obtained was weighed to determine its percentage value. The total nitrogen content of the stem was determined by kjeldahl’s digestion and distillation method and protein percentage was calculated. The stem was found to contain 8.5% of nitrogen equivalent to 53.69% of total protein.

**ISOLATION OF PHENOLIC CONSTITUENTS**

The natural phenolic constituents includes Phenols, phenolic acid, phenolylpropanoids, Flavonoids, Anthocyanins, Flavanols, Flavoners, Xanthones, stilbenes and Quionone Pigments, free radicle produce more than 100 disorders but phenolic constituents act as natural antioxidant and helps in its neutralisation. e.g. Pure Cocoa Powder has cancer preventive Phenolic constituents

The presence of the phenolic constituents were detected by

Neutral FeCl₃, giving red, violet, bluegreen coloration

0.1% FeSO₄ + 0.5% Na,K Tartarate ew drops giving blue, green, red to violet coloration

Vanilin H₂SO₄

The total phenolic constituents were determined by Folin Ciocataus reagent method and expressed in terms of GALIC ACID Equivalent

**Isolation of phenolic constituent**

**RESULTS AND DISCUSSION**

Result of preparative TLC and HPLC reveals the presence of 3-bromo,4-hydroxybenzoic acid and 3-
bromo, 4-hydroxybenzaldehyde as major brominates phenolic constituents in P. bicalyculata which were further isolated and identified by spectroscopy.

**Anti Microbial Activity[16]**

Phenolic constituents are widely distributed in nature particularly in the plant kingdom. They are generally biologically active and the anti microbial activity is the most common biological property observed from the phenolic substances[13].

It has been reported to be effective on wound healing[6], this phenomenon can be attributed to presence of the phenolic substances having halogenated compounds.

The phenolic fraction of P. bicalyculata displayed a significant antibacterial activity against Gram–ve bacterial E. coli, and moderate activity was observed in case of Gram + ve bacteria. In a case of fungal strains, significant activity was observed. The phenolic constituent taken displayed anti microbial activity against gram–ve bacteria E. Coli. (22mm), and a moderate activity was observed in case of gram + bacteria B. Subtillis (15mm) and S. Pyogens (13mm) in case of fungus significant activity was observed against strain A. Niger (20mm).
