ABSTRACT

Starting from pyrazolo[3,4-*d*]pyrimidine ethyl ester 4 and its corresponding acid hydrazide 5, several new compounds were synthesized such as schiff bases 6a-e, acetyl azide derivative 7, phthalimido derivatives 8, compounds containing oxadiazole ring 9,10a-c, triazole ring system 11, 14,15, thiadiazole moiety 13 and phenyl thiosemicarbazide part 12. Some of the synthesized compounds were screened for their antitumor activity against human breast adenocarcinoma cell line (MCF-7) using doxorubicin as a positive control. Compounds 6d, 10b, 12 were found to exhibit good cytotoxic activity with IC₅₀ equal to (4.6, 4.6, 4.8 µg/mL), respectively.

INTRODUCTION

Cancer still remains one of the most widespread and feared diseases in the world. Cancer cells are formed when the normal cells lose their normal regulatory mechanism which control their growth and multiplication. Gene mutation, including the activation of proto-oncogenes (e.g. Ras gene which is involved in the signaling pathway leading to cell division)^[1] and inactivation of tumor suppressor genes (e.g. P53 which codes proteins that are involved in checking, repairing or suicide the damaged DNA)^[2,3] is the most common cause leading to cancer.

Three approaches for the treatment of cancer are radiation, surgery and chemotherapy. Combination of chemotherapy alongside radiation and surgery is more effective and has less toxicity^[1].

2,6,9-Trisubstituted purines (e.g. CGP79883) were reported to have potent cytotoxic activity^[4,5]. Due to structural similarity between purines and pyrazolo[3,4-*d*]pyrimidines, great attention has been focused on pyrazolo[3,4-*d*]pyrimidines as antitumor agents^[6,7].

Several mechanisms were reported for the cytotoxic activity of this class of compounds, including: adenosine receptor antagonists^[8-10] and inhibitors of: CDKs^[4], IGF-IR^[11], Src^[12], Lck^[13], EGFR^[14], mTOR^[15] and P^{38α}^[16,17].

Many pharmacophores were introduced to pyrazolo[3,4-*d*]pyrimidines to increase their cytotoxic activity. For example, introducing hydrazone moiety to N5 of pyrazolo[3,4-*d*]pyrimidine derivatives 1 increase their activity toward breast adenocarcinoma MCF-7 cell line^[18].

Thiadiazoles^[19,20], oxadiazoles^[21,22], triazoles^[21] and

thiosemicarbazide^[20] moieties are also examples for such pharmacophores with antitumor activities.

Based on the above findings, we thought to prepare new pyrazolo[3,4-*d*]pyrimidine derivatives substituted at C6 2 with different groups of known reported

cytotoxic activities. Most of the newly synthesized compounds were subjected to *in-vitro* antitumor evaluation against breast adenocarcinoma cell line MCF-7 using doxorubicine -the known anti breast cancer agent-^[23] as a positive reference.

EXPERIMENTAL

General

Melting points were determined on a Graffin apparatus and were uncorrected.

Element analyses (C, H, N) were carried out on Perkin-Elmer 2400 analyzer (Perkin-Elmer, Norwalk, CT, USA) at the Micro analytical unit of Cairo University, Egypt. All compounds were within + 0.4% of the theoretical values. IR spectra were determined as KBr discs on Shimadzu IR 435 Spectrophotometer and values were represented in cm^{-1} . ^1H NMR spectra were carried out on a Bruker 300 MHz NMR Spectrophotometer in Cairo University, Egypt, using (Bruker, Munich, Germany) in DMSO-*d*₆ as a solvent, TMS as

internal standard and chemical shifts were recorded in ppm on δ scale. Mass spectra were run on Hewlett Packard 5988 Spectrometer, Micro analytical center, Cairo University, Egypt. Progress of the reactions was monitored by TLC using TLC sheets precoated with UV fluorescent silica gel MERCK 60 F 254 that were visualized by UV lamp.

Procedure for the synthesis of ethoxycarbonylmethyl-3-methyl-1-phenyl-1H-pyrazolo[3,4-*d*]pyrimidin-4(5H)-one (4)

A mixture of the amino carboxamide 3 (2.16 g, 0.01 mol) and diethyl malonate (10 mL) was heated under reflux for 8 h. The separated solid which formed after cooling, was filtered, washed with ethanol 95%, dried and crystallized from ethanol 95%.

General procedure for the synthesis of compounds 6a-e

To a suspension of compound 5 (2.98 g, 0.01 mol) in hot absolute ethanol (20 mL), the appropriate aromatic aldehyde (0.01 mol) and a catalytic amount of glacial acetic acid (0.5 mL) were added. The mixture was heated under reflux for 3-5 h (monitored by TLC), then filtered, washed with ethanol 95%, dried and crystallized from the appropriate solvent (given below).

RESULTS AND DISCUSSION

Chemistry

Synthesis of the target compounds was achieved by reacting 5-amino-3-methyl-1-phenyl-4-carboxamide (3)^[24] with diethyl malonate to give 6-ethoxycarbonylmethyl derivative 4. Hydrazinolysis of 4 with excess hydrazine hydrate in refluxing ethanol afforded the corresponding acid hydrazide 5 which was the key compound for synthesizing different new compounds.

Scheme 2 : Reagents: a) CS₂, KOH, ethanol; b) RX, K₂CO₃, ethanol; c) N₂H₄, ethanol; d) PhNCS, ethanol; e) Conc. H₂SO₄; f) 2N NaOH; g) EtNCS, ethanol, reflux or EtNCS, dioxane, r.t

Reaction of 5 with different aromatic aldehydes, namely, benzaldehyde, 3-hydroxybenzaldehyde, 4-chlorobenzaldehyde, 4-dimethylaminobenzaldehyde, 4-nitrobenzaldehyde in ethanol containing catalytic amount of glacial acetic acid gave compounds 6a-e in their two geometrical isomers *Z* and *E*. As arylidene-hydrazide structure was reported to exist in two geometrical isomers (*E* and *Z*) about $-C=N$ double bond^[25,26] and according to the literature^[27], compounds containing imine bond are present in higher percentage in dimethyl-*d*₆ sulfoxide solution in the form of geometrical *E* isomer about $-C=N$ double bond.

On the other hand, the acid hydrazide 5 was subjected to diazotization to give the corresponding azido derivative 7.

Moreover, reaction of 5 with phthalic anhydride in glacial acetic acid afforded the phthalimido derivative 8 (Scheme 1).

Oxadiazole derivative 9 was obtained from the reaction of acid hydrazide 5 and CS₂ in ethanolic potassium hydroxide. Compound 9 was used as a precursor for the formation of S-alkylated compounds 10a-c using alkyl or aryl halides such as methyl iodide, ethyl iodide and benzyl chloride. In addition, reaction of 9 with hydrazine hydrate in ethanol yielded triazole ring with N4 amino group 11.

Reacting the acid hydrazide 5 with ethyl or phenyl isothiocyanate afforded two different products. Phenyl thiosemicarbazide 12 was obtained and cyclized under acidic conditions using conc. sulfuric acid or in sodium hydroxide as a base, giving compounds 13 and 14, respectively. While, ethyl thiosemicarbazide not formed from the reaction of 5 and ethylisothiocyanate either in refluxing ethanol or in less polar solvent such as dioxane and at room temperature, instead the cyclized triazole containing compound 15 was obtained. This occurred due to the $-I$ effect of ethyl group of ethyl isothiocyanate which facilitate the cyclization process (Scheme 2).

CONCLUSION

Some of the newly synthesized pyrazolo[3,4-*d*]pyrimidin-4(5*H*)-ones were tested *in-vitro* on human breast adenocarcinoma cell line (MCF-7). Three compounds 6d, 10b and 12 exploited good antitumor activity. These results suggested that 4-substituted ben-

zylidene derivative with its hydrophobic character, substituted oxadiazole and phenyl thiosemicarbazide at C6 of pyrazolo[3,4-*d*]pyrimidin-4(5*H*)-one resulted in good cytotoxic activity.

BIOLOGICAL TESTING

Material and methods

The human breast tumor cell line (MCF-7) was obtained from NCI, Cairo, Egypt.

Measurement of potential cytotoxicity

The effects of compounds on the growth of tumor cell lines (MCF-7), were evaluated according to the procedure adopted by the National Cancer Institute, Cairo, Egypt for the *in-vitro* anticancer drug screening that use the protein-binding dye sulforhodamine B (SRB) to assess growth inhibition^[28]. Cell were routinely maintained as adherent cell cultures in RPMI-1640 medium supplemented with 10% heat-inactivated fetal bovine serum (FBS) and 1% penicillin/ streptomycin at 37°C in humidified atmosphere containing 5% CO₂.

Compounds were prepared in dimethylsulphoxide (DMSO), were freshly diluted with cell culture medium just prior the assays. Doxorubicin was used as positive control. For each test com-

pound and the cell line a dose-response curve was generated and the growth inhibition of 50% (IC₅₀), corresponding to the concentration of compound that inhibits 50% of the net cell growth was determined. The results of *in-vitro* cytotoxic activity experiments are presented in (TABLE 1).

Results of *in-vitro* cytotoxic activity of some of the newly synthesized compounds on human breast adenocarcinoma cell line (MCF-7).

Results and discussion

Compounds 6d, 10b and 12 showed significant antitumor activity against MCF-7 with IC₅₀ equal to 4.6, 4.6 and 4.8 µg/mL. According to the data obtained, we found that 4-dimethylbenzylidene derivative 6d was better than 3-hydroxybenzylidene derivative 6b this was thought to be due to hydrophobicity in 6d rather than 6b. Moreover, S-ethyl substituted oxadiazole 10b showed higher activity than the unsubstituted oxadiazole 9. In addition, phenylthiosemicarbazide 12 showed better antitumor activity than the two cyclized forms 13, 14.

ACKNOWLEDGMENT

We express my sincere gratitude to prof. Dr. samia shouman, Professor of Pharmacology, and also we are grateful to all members of the department of Cancer Biology, National Cancer Institute, Cairo, Egypt, for their co-operation and helping in carrying out the cytotoxicity testing.
