ABSTRACT

A simple and sensitive visible spectrophotometric method has been developed for the quantitative estimation of amlodipine in bulk drug and pharmaceutical dosage forms (tablets). Amlodipine exhibited absorption maximum at 410 nm in bromocresol purple 0.05% 2.4 buffer solution and obeyed Beer’s law in concentration range 4-20 µg/mL. The result of analysis in this method has been validated statistically and by recovery studies. This method is extended for the analysis of drug in pharmaceutical formulation.

Key words: Amlodipine, Validation, Visible spectrophotometric.

INTRODUCTION

Amlodipine is chemically 2-[(2-aminoethoxy) methyl]-4-[2-chlorophenyl]-1, 4-dihydro-6-methyl/-3, 5-pyridine dicarboxylic acid-3-ethyl-5-methyl ester, which is used in the treatment of angina pectoris and in hypertension.

Amlodipine inhibits the movement of calcium ions (Ca^{2+}) across the cell membrane into vascular smooth muscles and myocytes.

Molecular formula: C_{20}H_{25}ClN_{2}O_{5}

No reports are found in the literature for its quantitative estimation by HPLC, HPTLC and spectrophotometry. In the present work, a simple and sensitive visible spectrophotometric method has been developed for the quantitative estimation of amlodipine in the bulk drug and pharmaceutical dosage form. In this method, amlodipine exhibits absorption

maximum at 410 nm in bromocresol purple 0.05% 2.4 buffer and obeyed Beer’s law in concentration range of 4-20 µg/mL. The result of analysis has been validated statistically and by recovery studies. The method is extended for the analysis of drug in pharmaceutical formulations.

**EXPERIMENTAL**

All spectral measurements were done on UV-visible spectrophotometer Model Systronic 119.

**Reagents**

Analytical grade reagents were used and commercially available sample were purified before use.

(i) Bromocresol purple 0.05% in 0.1M NaOH and 20 mL of ethanol

(ii) 2.4 Acid phthalate buffer solution.

(iii) Chloroform.

(iv) Distilled water.

**Working standard of drug solution**

About 100 mg of amlodipine was actually weighed and dissolved in chloroform in 100 mL volumetric flask and the volume was made up to mark with chloroform (1 mg/mL). The final concentration of amlodipine was brought to 100.00 µg/mL with chloroform.

**Sample preparation**

One branded commercial tablets (from two tablets) were analyzed by the proposed method. 20 Tablets of formulation each containing 10 mg of amlodipine were accurately weighed and powdered. Weight of tablet equivalent to 100 mg of drug was taken in 40 mL of chloroform and shaken for 15 min and filtered into 100 mL of volumetric flask using cotton wool and then remaining amount of chloroform was added. Final concentration was brought upto 100.0 mg/100.0 mL with chloroform.

**Assay**

Aliquots of amlodipine ranging from 1 to 5 mL (1.0 mL = 100 µg) were transferred into a series of 250.0 mL separating funnel. 5.0 mL of 2.4 buffer solution and 5.0 mL of 0.05% bromocresol purple were shaken for two minutes and organic layer was transferred to
25.0 mL volumetric flask and volume was made up to the mark with chloroform. The absorbance of this solution was measured at 410 nm against reagent blank. The amount of amlodipine present in the sample was computed from the calibration curve.

RESULTS AND DISCUSSION

The optical characteristics such as absorption maxima, Beer’s Law limits, molar absorptivity and Sandell’s sensitivity are presented in Table 1. The regression analysis using the method of least squares was made for the slope (b), intercept (a) and correlation coefficient (r) from different concentrations and the results are summarized in Table 1. The percent relative standard deviation and percent range of error (0.05 & 0.01 level of confidence limit) were calculated from eight measurements 3/4th of the upper Beer’s law limits of amlodipine and these are given in Table 1. The results showed that this method has reasonable precision.

The proposed method was found to be simple, sensitive, selective, economical, accurate and precision and can be used for determination of amlodipine in bulk drug and its pharmaceutical dosage form in a routine manner.
